1. Antenna connector

Newsgroup: rec.radio.scanner
Date: 1994-08-01 00:40:00 UTC
From: steve.andrews@lunatic.com
Message-ID: <3812.1347.uupcb@lunatic.com>
Source record: 271072

I have a Bearcat BC200XLT handheld scanner. Over the years I have switched antennas enough to wear out the connector. I get a lot of noise and cutting out when I touch or wiggle the whip.

It seems the female hole that receive the male pin in the connector has been worn to a larger diameter and is not grasping the pic tight enough.

Is there a way to replace this female connector and what is involved. I have for years resisted the urge to crack the case on this puppy but guess Im gonna have to now.

Any help would be appreciated.

Message-ID: <00060C1B.fc@aardvark.bah.rochester.ny.us>
Source record: 271060

Most micro wireless bugs operate in the 88-108 Mhz range (FM music radio) but some can be tuned past 108 and into 120 and 130 Mhz. Unfortunately your scanner isn't capable of monitoring these frequencies so the only thing I can think of it that radio shack wireless transmitter thing for like 50 bucks... I have one, its on 49.860 I think.

Hi, I'm setting up a very low power radio station for fun, (got that kit from Ramsey Electronics) and need some antenna ideas. I use a half-wave dipole for cordless phones which works extremely well, but if I were to cut one to length for ,say, 100Mhz, could I transmit efficiently on it? They reccomend a "dipole". If a half wave dipole for 49 Mhz is 10 feet, would the dipole be 20 feet?

Message-ID: <e7.7758.2508.0NE7309B@pcgfx.com>
Source record: 271058

HELP! I'm looking for a low cost receiver to use with my M1200 to read ACAR's. I know for a fact that a YUPI 7100, Icom 7100, Yeasu 9600 and old Regency will work fine. I know a Pro 2004/5/6 ,Pro39/41,Pro 2028,AOR-900, and Sony 2010, will not work.

Anyone out there using an M1200 or M400 to read ACAR's; What type of receiver are you using?

Thanks

Larry

8. info on DDI? (digital data interpreter)

Newsgroup: rec.radio.scanner
Date: 1994-08-01 03:29:35 UTC
From: jl@lpl.arizona.edu
Message-ID: <31hq6v$guc@news.CCIT.Arizona.EDU>
Source record: 271062
Cross-posted to: alt.radio.scanner,rec.radio.scanner,alt.2600

Does anyone have any information on a device that can decode digital computer transmissions encoded on an audio signal? (And optimally interpret the digital data as cellular phone comands.)

I have heard about a DDI test set, but the information is a bit dated. Does anyone have any more recent information on this product? (Or really any piece of equipment that can decode cellular phone transmissions.)

Thanks much,

Joshua.

: Just got a list of bands that the Pro-51 will scan (officially without
: mods).

: 29-54 Mhz
: 108-136.975 Mhz
: 137-174 Mhz
: 406-512 Mhz
: 806-824 Mhz
: 851-869 Mhz
: 896-956 Mhz

: Is this missing anything really crucial? Which bands are opened up with
: the software mod? Does anyone have the actual key combination for
: modifying it?

Radio will get 800mhz band continuous up to 956 mhz.

Not without knowing the trick of course!
Mine is great. Works great, no intermod and scans a whopping 50 channels per second. I bench tested my radio the other day and it was scanning at about 60 channels per second. Faster than you'll probably need, yet efficient enough to catch all the action.

Jay

The Annapolis police are in the 800s. But you could find fire and other police of the surrounding area in the mid-100s. Good repeater action would be around 140-160 or so. Another spot might be in the mid 400s.

Hope this helps. :-)

13. FCC License Data Sources

Newsgroup: rec.radio.scanner
Date: 1994-08-01 07:00:22 UTC
From: bill@thd.tv.tek.com
Message-ID: <31i6i6$ico@news.tv.tek.com>
Source record: 271069
Cross-posted to: rec.radio.scanner,rec.radio.info

[last changed 05-Jul-94]

Changes preceeded by "|". Please e-mail corrections and additions to me.

INTRODUCTION

This is a list of FCC license data sources available to scanner listeners. The FCC master contains a wealth of data about every non-government license in the United States. Most of the sources below contain a subset of this data, although a few contain all of it. Government licenses are not administered by the FCC, and the data is not available to the public.

If you are interested in purchasing the data, you might want to consider forming a co-op of people in your area to share the cost. As far as I know, this is legal since the information is in the public domain. However, most software supplied to view or manipulate the data is copyrighted and must be purchased separately by each user.

Prices are rounded to the nearest dollar and include shipping, if known.

C.E.T.

CET sells records of all stations inside a 30-mile radius for $80. (Major cities cost extra.) A 70-mile search costs $178. The data is provided on floppy disks and is available in ASCII columnar and comma-delimited formats.

CET does not provide data for licenses that do not contain specific geographic coordinates (i.e., mobile-only systems) or specific operating frequencies (e.g., amateur radio).

To do the search, CET requires the latitude and longitude of the center of the 30-mile radius. I calculated mine from a USGS topographic map I obtained at a local nautical supply store. Alternatively, you can obtain the coordinates for your town from the University of Michigan's geographic name server. Run "telnet 141.212.99.9 3000" and enter your zip code. For my area, the server returned the coordinates of the main post office.

CET can be reached at 800-445-0297.

GROVE

Grove sells FCC data on disk by state. The first state is $40, and each additional state is $30 (add $10 for CA, FL, TX). The disk comes with a database search program. Grove Enterprises can be reached at 800-438-8155.

MICROFICHE

The Bearcat Radio Club sells the FCC master by state for $15. Bearcat Radio Club can be reached at P.O. Box 291918, Kettering OH, 45429.

PERCON

PerCon sells a variety of FCC data on CD-ROM and floppy. CD-ROMs are available by region or category, and floppies are available by state. Also available is a CD-ROM of the entire US (2.5 million records). Data is updated approximately every six months.

State floppies are $60 per state (add $5 for CA, FL, NY, TX, PA, OH, IL). Regional and full US CD-ROMs are $105 each. CD ROMs by category are $155 each. Quantity discounts available. PerCon can be reached at 716-386-6015.

POLICE CALL

This is probably the most cost-effective source of public service license information. The detail is limited, but the information that is there is often more useful than the FCC master. For example, an entry in Police Call that reads, "Portland Police, Net 3, North Precinct," reads, "Portland, City of" in the master.

Police call is available in 9 volumes covering different regions of the US. It can be purchased at Radio Shack stores for $10 per volume.

SCANWARE ASSOCIATES

ScanWare Associates sells a PC-based database program called the FCC Frequency Retrieval System V2.0. It comes with FCC data for one state, covering all services from 10 kHz through 2036 MHz. Data is updated approximately every six months (last update was Dec. 1, 1993).

Cost is $35 for the first state and $20 for each additional state. (Add $5 for CA, FL, TX, NY.) Quantity discounts available. Fully working shareware copy downloadable from their BBS at 206-871-4228 (FCC200.ZIP). ScanWare Associates can be reached at 206-698-1383 (voice) or 206-698-8207 (fax).

I'm just curious, but are scanner owners the only ones who realise that CelTel conversations can be intercepted?
Normally I dont listen to that area, but Saturday I was bored and set up to scan the 800mHz block.
I heard 2 drug transactions, 1 person leaving their spouse this week, and another talking to their lover(not spouse).
I dont even think about giving out info over my cordless phone that I wouldnt want published on the front page of the Washington Post.
Well thats my 2cents worth.
Thanks for indulging me.

I had the same thing happen on a couple of scanners. I opened the
case only to find the solder connections were loose. Got the
ol' gun fired up, globbed a little more solder on the joints,
and all was fine. If your antenna connection has a nut, make
sure it is tight. Chances are you trouble is the antenna connection
inside, not the female conductor part. Hope it helps.

Mike

I've read of a similar device in "popular Communications" a couple of
years ago. It was attached between an AOR 1000 and PC laptop for
portability. Apparently you could read all cell data...ESN and phone
numbers. aalso would read which freq. to change to in a hand-off to
another cell. One interesting feature was to tag a specific cellphone
and would not activate until detected. As advertised it was about
$5000 and only sold to law enforcement. Dont know if there is anything
else out there. Any programmers out there have any ideas about using
a SoundBlaster card for this...HHMMMMMMM???

So the cable goes out last night and I call the answering service who says they've paged the techies and I'm wondering what's going on when I remember . . . I have a scanner--so I take out my Official Massachusetts Scanner Guide, which as close to an encyclopedia as you can get, and I don't find TCI, which is kind of odd since how many ways are there to spell Telecommunications, Inc., and the office is located on Stevens Street in Andover, but as I looked through the Guide and Beyond Police Call I realized I didn't see any listings for any cable companies, although I didn't look too hard for anything other than TCI Andover, which leads me to the questions:
(1) Does anybody know the frequencies for TCI, Andover, and
(2) Is it just that the Guide really isn't all that encyclopedic or do the cable co's have regional frequencies that tend not to appear in standard listings?

They wouldn't communicate by cell phone would they?

Thanks.

CSI has a kit that allows a pc to control various makes of scanners.
I think that it cost about $500. It is sold as a cell phone "test" unit.
It will probably perform the functions you have in mind. To take this
unit for a "test drive", ftp to ftp.funet.fi and get
pub/dx/software/msdos/rx-control/celldemo.zip. Till later, Si B.

The DDI you saw might have been the one that blocks the ESN & MIN information. I recall reading about one that was about that price range. There are those models that do display the ESN & MIN but they are quite expensive and only available to law enforcement. A long time ago there were DDIs that could decode cell traffic, and they were around $500. Now they are realtively hard to find.

As far as using your sound blaster, the answer is yes. I was able to pull off cell information (actually and friend and I) using a simple digital sampling program. I want to say Blaster Master, but I recall the resolution wasn't fine enough. I'll have to ask him which program we used. We were using 8bit 44kHz sampling with the scanner plugged directly into the soundcard (no microphones.) With this one program we were able to zoom in on enough of the handoff information to start to decode it (it uses a form of FSK.) In 0's and 1's. After many long attempts at getting this to work 100%, we quit. It worked, but it was way too hard. Now if you have a full functioning knowledge of FFT and DSP programming.. then you might have a MUCH easier way of doing this.

Enjoy,

John Herndon (jwh@kaiwan.com)

31. Posting of Cellular Mods

Newsgroup: rec.radio.scanner
Date: 1994-08-01 19:30:31 UTC
From: jim@ttech.com
Message-ID: <jim-010894113031@jimsmac.ttech.com>
Source record: 270991

I want to express my appreciation of the postings pertaining to modification of currently available scanners. On the other side of the coin, I am concerned about the posting modifications to CURRENTLY available scanners on rec.radio.scanner. This will call undue attention to the radio by the FCC or any other legal agency that could be reading rec.radio.scanner, and is equivalent to posting a front page article on in the LA Times. This will result in the elimination of the radio, or production of the crippled "A" model. In the case of current model scanners that have hidden test modes or possible mods, I suggest the following method of providing this information:

1. Post you request regarding modifications to rec.radio.scanner.

2. Ask for modifications (do not specifically ask for illegal modifications)

3. All replies regarding scanner modifications should be via E-Mail only.

There is an abundance of excellent information available on this newsgroup, and we must all make an effort to ensure proper disemination of that information. Some scanners manfacturers have given us excellent options, and we do not want to loose them.

My $.02

-Jim

>You can get a copy of the ARRL Antenna HandBook and build your own.. A
>ham radio store can supply you with the impedence matching balun, these
>are available with a coax to wire connectors.

An easy way to improve your 30-50 scanning experience is to make a 10 foot dipole (468/frequency in MHz = length in feet, so 468/46.8MHz which is in the cordless phone base band, equals 10 feet) out of Radio Shack speaker wire (24 feet of #42-2478 on page 23 of the 1994 catalog). Also, get a RCA to BNC adapter. Take one end of the wire and cut off the BNC, leaving a few inches of wire on it (you'll use it later). Take the 23 feet or so of wire and seperate the cut ends about five feet apart so that it stretches ten feet end to end. Mount this dipole on the wall, ceiling, or somewhere up off the ground. You may find slightly more signal strength if you mount it vertically. The rest of the length is so you have plenty of wire to run from the antenna to your scanner. Of course, if you need a longer wire run, use the 50 foot wire. Since 30-50 is a pretty low frequency, cable losses are minimum. You'll be amazed at the improvement in low band performance from this inexpensive antenna. Now, for that other BNC end piece you cut off, seperate the wires until you have about three inches of wire on each side. Use an ohm meter to determine which wire is the center lead. Completely cut off the ground wire and leave two or three inches of the center conductor wire. Get another RCA to BNC adapter and you have an average antenna for cellular and more importantly, a good antenna for very strong signal situations where a regular antenna gives you overload. Since this short antenna is almost worse than a rubber duck, it is ideal for use at concerts, finding wireless mikes, etc. without picking up other interference.

>The Police in my area apparently use Motorola Sabre portables. Can anyone
>give me anymore details on them ?
[snip]

I can tell you something about them since I use one. For general purposes its your typical high end, Motorola brick. Mine is UHF and we have a small fleet of VHF units for special work. The Saber I is a 12 channel radio. The Saber II and III have 120 channels (III has a DTMF keypad) Each channel, or mode, can be programmed with it's own parameters (power, PL, rcv only, t/r split, etc).They can be equiped with Motorola "Securenet", a DES encryption system that we use for those special VHF jobs. Saber II and III have selective scan ability.

There is a exported radio that is similar in appearance and function called an MX1000. I have only used a 10 channel version of that radio at one of our foreign locations.

What type of details are you interested in? I have listed some general things here but I am not sure what you are looking for.

I like the radio. A lot of capibilty in my III. The drawback is it's size and weight. My other favorite is the new Motorola Visar. A smaller radio capable of up to 16 channels.

Keep an eye out for people using Motorola's new ASTRO radios. These are analog and digital capable all in one. This type of equipment may get more prevalant over the next few years. They can be "Flashport" configured for trunking. If trunking drives scanner users nuts now - wait until they start trunking 6.25 KHz digital audio.

I saw a post here that stated someone had lost the little guide book for the telescoping antenna from RS. Here is a psuedo guide with abbreviated synopsis.

25-136Mhz:

----------==----------
(full length)

138-174Mhz:

----------==-----

(extend only top four sections)

220-1296Mhz.

--==----------

(extend only lower 1 to 3 sections)

Hope this helps!

Radio Shack. They're everywhere.
The major radio outlets in the area are in NH (HRO and Rivendell's) but their scanner selection isn't that great. Unless you're particularly eager to put your hands on something, you're better off (pricewise) with mail order.
(You can also find lower-priced and limited feature equipment at some of the discounters in the area such as Service Merchandise, Lechmere, and Circuit City, but IMO you're better off at RS).

Two people suggested U-Do-It Electronics out in Needham. It's been a while since I've been there, so I'll have to (but am willing to) take their word for it. Since they haven't posted, I've reposted.

43. Canadian version of Pro-43

Newsgroup: rec.radio.scanner
Date: 1994-08-02 02:34:15 UTC

I am about to buy a PRO-43 from RS in Canada and I'd like to know if there is any difference (in terms of potential MODS) between the Cdn version and the U.S. version of the PRO-43. It seems most RS stores in the U.S. are sold out of the PRO-43 but in Canada, (at least the RS's in my city) stores seem well stocked. Does anyone know if the PRO-43 sold in Canada can be modified to receive cellular?

Also, is there a way to distinguish between unmodifiable Pro-43s and non-modifiable ones in Canada similar to the system in the U.S. using the "A" suffix on the FCC #?

Any help would be appreciated.

Paul

bill nelson (billn@hpcvaac.cv.hp.com) wrote:

<<< Engaging Flame Mode >>>

: This can be argued. While kits are not directly mentioned in the ECPA, they
: are mentioned, and regulated, by the FCC in other regulations. The FCC has
: also explicitly stated that frequency converters are banned, if they are able
: to convert the cellular frequencies. Of course, there are exceptions for the
: governmental agencies and people in the cellular phone business.

I have in front of me the new 1994 Ramsey Electronics Catalog. If
you did not know who they are, they sell Electronic Kits.

They can be reached at: 1-800-446-2295

Ramsey Electronics Inc
793 Canning Parkway
Victor, New York 14564
(716) 924-4560 Voice
(716) 924-4555 Fax

CURRENT CATALOG:

Page 14

SCN-1: 800-950 Mhz Scanner Converter Kit $49.95
CSCN: Matching Case Kit $14.95
SCN-1WT: Fully Assembled SCN-1 and Matching Case $89.95

Page 10

SS-70: Speech Descrambler/Scrambler Kit $39.95
CSSD: Matching Case Kit $14.95
SS-70WT: Fully Assembled SS-70 and Matching Case $79.95

Now someone will say "old catalog".

Ok, for that person I will say Monitoring Times, August 1994,
See page 77 for details. All the same devices as described above.
These devices are supposedly illegal to market in the U.S.

Is that current enough advertising?

This is a good example those converters that are banned, so much for
the ban -- on kits or otherwise!

: Now, it might be legal to sell the parts, as repair components.

Now we are getting somewhere!

: : Since from the Factory, they come with cellular, and they remove it
: : by something as simple as changing a component (adding/removing a
: : component), WHY would the FCC approve such a unit next month? I mean
: : it clearly violates the law as much as any other scanner from the
: : past 3-5 years would have?

: The FCC has said that the simple adding or removing a component is NOT
: sufficient to disable cellular frequencies - that would be "easy conversion".
: Now, if that component was a surface mount 20+ pin chip, then it would most
: likely be sufficient. Changing that would not be easy for the average person.

Yes, but to modify it here -- I'd expect it to be something simple
not needing to be done at the factory. Additionally, a new approach
is to buy it here, like a Pro-43 and order the UK version of the
digital board. Don't bother with the SMD components, just replace the
whole digital board (it contains the CPU, diodes, not much else, could
not cost much more than the CPU would). As a replacement board, it
would do the job.

: : Is there ANYTHING in the law dealing with preventing the dealers
: : and manufacturers from selling the parts used in their overseas
: : units -and- instructions to upgrade them to international capability?

: Not that I know of. However, if it becomes common, the FCC will simply
: refuse to grant type acceptance to future models that do not have the
: rf section for 800 MHz completely removed.

That will be the point where everything is imported (for show, not
use, would not dream of that!)

: : Remember, kits and parts are EXEMPT from the law. Not addressed once.

: See above.

Yes, I agree, SEE ABOVE, Ramsey has no problem selling converters
and speech inversion descramblers. I sure don't see what anyone
else has to worry about (regarding imports and such!)

BE AMERICAN! BUY NON-US! DON'T SUPPORT THE NAZI'S IN D.C.!

I'm currently using a uniden 855 xlt and would like to hear
anyones experiences/horror stories with the radio shack 10-20 decible
antenna booster, I know it's made for t.v. but they do suggest it in one
of "their" manuals for the pro 2022.

If it's worth the $23 they want, maybe my wife will let me get one...

33.66 is the Montgomery County PA F-2 fireground freq. for all areas
EXCEPT the eastern portion (which is on high-band).

I love my 350 but would like to see some minor changes
made. For one thing, there is no priority feature. Sometimes
when there's something big going down and a department is using
two channels for operations I have to manually lock out all the
other channels in the private bank.
The radio is easy to program once you understand how to
do it. The buttons are easy to find without having to look at
the keys. It picks up incredibly well even with just a small
3" uhf transceiver antenna I have mounted through the roof of
my vehicle.
I also like the fact that just about any freq. you want
to hear is already in the radio. I've found some interesting
stuff just by scanning through the factory presets. One other
improvement I would like to see would be more control over the
search bands. the pre-programmed search bands are a little too
broad. If I want to search between say 46.000 and 50.000 I
either have to wait for the radio to complete a search starting
back at 30.00 or manually work the up/down controls.
The prices have gown down since I bought 2 of them
about a year ago. I saw them on the home shopping club for
around $109.00 the other day. I would go ahead and get the
800MHz model just to have the future capacity and a
potentially modifiable radio.

Another good point! There has been numerous articles in the local paper
about the dangers of 'broadcasting' private info on cordless or cell telephone.

All I can say is that my neighbors should be damn glad I'm so honest and
won't use their credit card numbers, etc. But if I hear something illegal
that't another story!

52. PRO 30

Message-ID: <1994Aug2.113714.10400@ultb.isc.rit.edu>
Source record: 271020

I recently purchaced the SportCat, founf it can not be modified ... or is atleast not known to be modified. Since the 200XLT is readily modifiyable, I exchanged it. After opening it up, I could not find any resistor to cut for a mod. The processor had an 'A' affixed to it's ID also. Perhaps the newer 200XLTs cannot be modified? I think I'll have to settle for the unmodifyable SportCat. . . but it's quite a nice unit.

61. 46 mhz log periodic antenna

Newsgroup: rec.radio.scanner
Date: 1994-08-02 16:10:18 UTC
From: magnet@nRCHs022
Message-ID: <31lr5a$8k1@corpgate.rich.nt.com>
Source record: 271021

I would like to experiment with antenna building. One fun thing to do would be to build a very directional antenna for 46 mhz. I was thinking about using a PVC pipe as a beam to hold the elements of a log periodic antenna. Would anyone care to give me some advise or clues on what the best plan of attack would be.

What I need to know is (this is my first antenna project) how to design a driven element and the reflector/director elements for this application.

PLEASE do NOT refer me to any reference materials!

No you shouldn't lose any coverage. Are you sure you remembered to solder the antenna connections back on? If you have strong 800MHz signals they will come in just fine right through the radio's case, but the weak 46MHz signals won't. With no antenna at all on my '43 I can get the 155MHz Co Sherriff the 460MHz police and 800MHz cellular. Talk about a strong signal environment. So go back and check those solder joints.

Good scannin' to ya.

It wasn't I, but I would restate it as "If it passes uninvited
through my body, I have the right to do with it what I please."
It makes the issues much less ambiguous.

For example, I wouldn't fiddle with phones (wired or cellular) because it
involves sending something from *me to them*. I wouldn't get an illegal cable
descrambler because I've invited the signal into my house.

I do not have a satellite dish. If I did, I believe my attitude would be
"If you don't want me descramlbing your signal, don't send it through me."
But, not owning a dish, I admit I haven't thought the issue through
completely. Others' thoughts would be appreciated.

A log periodic dipole array (LPDA) is not a very directional antenna. They
are designed to cover relatively wide bandwidths but their gain is not the
highest. An LPDA is group of dipoles designed to work together. There is
generally no single driven element. All of the dipoles (elements) are usually
driven. A region of the array becomes active for a given frequency and the
remainder of the array acts as the reflectors/directors.

While I say that the LPDA is not very directional, I mean that in relative
sense. A yagi antenna, even with fewer elements, can give you a narrower beam
width and better gain. Although the yagi may have to be longer and have a
bigger "wingspan". The Yagi (or by it's full name, Yagi-Uda) is probably what
you are looking for.

A good example of an LPDA would be a directional TV antenna. Usually fed at
the front with every other element reversed 180 degrees. It is also important
to note that the elements are electrically isolated from the boom (if the boom
is conductive) unlike a yagi.

I have built a LPDA for 144-148 MHz. Yagis are much easier to build.
Measurements are more critical on the LPDA and the booms will involve more
work.

This brings up a question that I was thinking of asking just
yesterday. I caught (Well, y'know) a Coast Guard Helio over the
edge of the Charles River here in Boston and I quickly tried to
scan for it on my handy-dandy PRO-43. I got bupkis. Is there a
change in radio operations when they aren't at sea? Do they
adhere to land based rules when flying within a particular range
of land? I'd imagine they monitor the common freqs (ie local
TCA's and such) but what do they use otherwise?

73. PRO-43 performance: AC vs. batteries

Newsgroup: rec.radio.scanner
Date: 1994-08-02 18:47:57 UTC
From: M22646@mwvm.mitre.org
Message-ID: <17006D01ES85.M22646@mwvm.mitre.org>
Source record: 270919

Hello,
My Pro-43 receives signals in the 40-50 MHz range much better when running off the AC adapter instead of batteries (rechargeable NiCads or alkaline). Why? Does it have anything to do with the radio being grounded when plugged in via he adapter? Has anyone else noticed this? I'd like to have better reception when running under battery power. Any ideas? Thanks!

There was an article in Monitoring Times a few years back that listed every frequency in use in the park, all the way down to what the service station tow trucks use. I had a copy of that article and I LOST IT!!!!

PLEASE!!!! Does anyone have back issues of Monitoring Times, who could copy that article for me? I'm leaving for the park next week!

Antennas such as those do not need to be "grounded." As you mention, there is no way to ground them anyway. Even if you had a wire that went directly to the earth, it would probably be multiple wavelengths long, resulting in anything but "grounding."

Many antennas, such as dipoles, are made to be fed
with a balanced transmission line. If you feed it with coax, you should use a balun of some sort, either transformer based, or variations including a sleeve on the outside of the coax, or looping the coax near the feed point.

This transforms the unbalanced coax transmission line into a balanced system at antenna feedpoint.

You can find help on this in the ARRL Antenna Handbook, or the textbook, Antennas, by Kraus.

Patrick,

Ok, now I am not an expert on this but here goes. The police are probably
communicating with the chopper on a tactical channel, i.e., one of there
special freqs. Do you have all of the police freqs programmed into your
scanner??

|>What I need to know is (this is my first antenna project) how to design a
|>driven element and the reflector/director elements for this application.

|A log periodic dipole array (LPDA) is not a very directional antenna. They
|are designed to cover relatively wide bandwidths but their gain is not the
|highest. An LPDA is group of dipoles designed to work together. There is
|generally no single driven element. All of the dipoles (elements) are usually
|driven. A region of the array becomes active for a given frequency and the
|remainder of the array acts as the reflectors/directors.

|While I say that the LPDA is not very directional, I mean that in relative
|sense. A yagi antenna, even with fewer elements, can give you a narrower beam
|width and better gain. Although the yagi may have to be longer and have a
|bigger "wingspan". The Yagi (or by it's full name, Yagi-Uda) is probably what
|you are looking for.

Does a yagi look like this?

```

>What I need to know is (this is my first antenna project) how to design a
>driven element and the reflector/director elements for this application.

>PLEASE do NOT refer me to any reference materials!

Is that because you are afraid that you might learn something?

What if the reference book said that log periodic antennas are
non-ideal for fixed-frequency use? Or what if the reference book said
that you would have different results depending on the polarization of
the received signal? Or what if the reference book discussed the
legal antenna lengths of Part 15 devices? Or what if the reference
book compared and contrasted yagi, quad, quagi, phased vertical,
and/or circularly polarized antennas? What if the reference book
discussed optimum feed lines versus operating frequency and
transmitter power? What if the reference book discussed the
advantages of antenna gain versus frequency excursion?

To recap, then, you would rather have an anonymous stranger send you
an ASCII file that shows how to design a driven element and
reflector/director, than to go to a library and look at drawings and
charts with a textual description, written by an authority on
antennas, right?

Good luck.

The DDI (current model is -D, I believe) is made a company (one guy,
as far as I know) in Wisconsin. The Canadian ECI unit is the DDI
(same internals). I'll look up the address and telephone, if you're
interested. You'll need to have a decent scanner, and it's recommended
that you get audio from inside the scanner (modification instructions
are available for most popular scanners).

In the greater Phoenix Arizona area, the police choppers use the normal AM aircraft freqs when flying around (FAA requirement) However they use the police UHF (430MHz band) when talking to the police on the ground during chase and law-enforcement activities.

Well, now, isn't that the point of scrambled comms?
The motorola system, and it's cousins, are pretty sophisticated and
certainly not something you'll be able to go to the store and buy
a "descrambler" for. The only thing I'd suggest is trying to get a Saber
radio and having it "keyed" to the system. The local PD should be happy
to do it for you.
The only really easy scramble to counteract is frequency inversion, which
takes all of about $10.00 worth of junkbox parts to counteract. See
Popular Electronics Magazine, I think it was a year or so ago, for the
circut.

[a brilliant followup by Dave Bushong of Wang Imaging deleted, but saved
in my home directory]

[an now my comments...]

Look, if this is your first antenna project, there is no better reason
to go to the library, or connect to one of the fine Ham Radio newsgroups
here on the Internet. Nobody is going to be able to simply tell you how
to build an antenna to listen to cordless phone calls in a 32kb chunk of
text.
If you really want to learn to build and antenna, then learn. But if you
want to be spoon fed, offer someone on this newsgroup $$$ to build one for
you. They'll do it better, and faster than you can. Of course, its
because they "bothered" reading the reference material.
Oh, and a Yagi antenna looks alot like this:

|=|=|=|=|=|===| of course, the element lengths vary,
| but you'll have to look at a reference
| book to find out what size and polarity
| you'll need for your project.

In the City of L.A. the air units typically use one of the Tactical freqs.
to communicate with ground units. Try Tacs 2-7 plus the freqs.
for your local division/bureau as listed in {Police Call}, etc. They
also like to use the repeater output frequency for the "emergency trigger"
freq. (Tac 8?), that way whatever the helo transmits doesn't get broadcast
throughout the whole city. Going to simplex mode on any Tac has the
same effect. Just program the listed frequency for the Tac channels
into your scanner. If they're nearby operating in simplex you'll hear them.
(I've been disappointed on more than one occassion when units participating
in something interesting half-way across town switch to simplex and
can no longer be heard.)

Someone else replied with info on the usual air-to-air freqs, 123.075, etc.
Those are interesting on occasion, too.

Rob

93. Fast Food Freq. collection

Newsgroup: rec.radio.scanner
Date: 1994-08-03 01:09:19 UTC
From: pwd@apple.com
Message-ID: <pwd-020894170919@17.130.21.21>
Source record: 270898
Cross-posted to: rec.radio.scanner,alt.radio.scanner

People occasionally request listings of the frequencies used by various fast food drive-ups to link the drive-up to the main restaurant. While listening to people order various combinations of burgers and fries gets old pretty fast [although I've never tried it for any real length of time], some of the frequencies below are also used to link the employees working at the drive-up window to the other kitchen staff and THOSE channels occasionally contain interesting listening material. While there seem to be some favorites (30.84MHz and 154.57MHz seem to be in particularly widespread use), most channels seem to be spaced 12.5KHz in some fairly narrow bands. I don't know what the limits are of the bands in question but I believe there's a general "low-power business use" portion of the frequency spectrum set aside for just these sorts of uses. There are undoubtedly many frequencies in that range not specifically listed below, but it should be easy to scan around the listings found below.

Note that some frequencies seem particularly popular for internal use: 82.5MHz, 88.5MHz, and 100.0MHz are used exclusively for private lines. These might be worth programming specifically.

The listing can be read horizontally to see who's on a particular frequency or vertically for some of the major chains to see which frequencies they've used elsewhere.

This list was compiled from numerous posts on the Internet news groups alt.scanner and rec.scanner from many posters, among them:

Brad Steinman (cscon0151@uoft02.utoledo.edu, 131.183.1.4),
mcneill@salem.enet.dec.com,
Bob Parnass (parnass@ihlpm.att.com),
stretch1@aol.com.

Thanks for sharing the information!

Hope this helps; have fun,

94. NEW version of 200XLT, Mods please!

Newsgroup: rec.radio.scanner
Date: 1994-08-03 01:23:07 UTC
From: cap2624@ultb.isc.rit.edu
Message-ID: <1994Aug3.012307.1313@ultb.isc.rit.edu>
Source record: 270914

SInce I have purchaced (and returned) both the Uniden SPortCat (which I like alot, but so far cant be moded) and the BC200XLT, which turned out to be a new one with no resistor to cut to get cel. The Cpu in the newer XLT has the letter "A" appended to the CPU ID. In the processes, I have notice that BOTH the new 200XLT and sportcat are VERY similar in circuits, however the SportCat has a different processor (UC1611).

1. Where can I get the NEW 200XLT mod?
2. Might this mod work on the SportCat?
3. Is the UC1611 used in other scanners that can be moded?

In any case, I have now picked up the PRO-51. It is a fairly nice unit, though I like the SportCat's feel. The "Back Door" test code works.

Note: Back door test codes work ok the new 200XLT and the SportCat, HOWEVER the 200XLT cannot scan from the 888.xxx Frequency, and the SPortcat has omited the 888 Mhz Frequency from it's test selection all together.

>)Option 3: (My favorite.) Show up at the place and wait for them...

A few years ago, a similar situation was reported here on Long Island. A scanner listener overheard (on 46 MHz) some guys planning to burglarize a commercial establishment. The listener reported the incident to the PD and an arrest was made. I can't remember if it was an anonymous tip or not, but it was written up in the local papers.

The main point is that cordless phones are NOT protected by wiretap laws, and information gathered on 46 or 49 MHz can be used against the "perp." Cellular conversations ARE protected by wiretap laws; they can be used only if the proper authorities have gotten permission to intercept them.

If I heard a life threatening situation on any freq, I think I'd go the anonymous tip route -- from a pay phone!

97. Need formula for pocsag on m-400

Newsgroup: rec.radio.scanner
Date: 1994-08-03 02:24:13 UTC
From: milcom@netcom.com
Message-ID: <milcomCtxtCE.A7C@netcom.com>
Source record: 270911

The m-400 decoder in pocsag mode doesnt display correct cap codes.
I hoping to find a math wiz or somebody who has a math/decrypting type
program. Here are ten examples of transmitted capcodes and output of m-400.

Transmitted capcode Displayed on m-400
0006735 001511
1111111 417210
1999999 750217
1666666 626715
1888888 715112
1555555 573614
1222222 452311
0000001 000000
0000011 000001
0000111 000015
0001111 000212

It is interesting that the universal m-400 capcode output never has
numbers greater than 8 indicating the output may be octal? These results
arent random, but consistant each time the page is sent. Capcodes must
have seven digits. The output after the capcode, such as fone number
always decode correctly.
I know that some public safety uses paging, like fire departments for
selective calling. So this can be a boon for fire department junkies...
or who knows what else.

101. Antenna Ground?

Newsgroup: rec.radio.scanner
Date: 1994-08-03 03:11:39 UTC
From: pcapps@delphi.com
Message-ID: <ZSywrPz.pcapps@delphi.com>
Source record: 270901

Dear All,

I recently bought two radio antennas. One is for FM stereo reception (RS 15-1636) and the other is a discone antenna (RS 20-013) for my scanner. I have them mounted on a 20' mast attached to the side of my house and resting on the ground. The discone antenna is at the top of the mast and the FM antenna is mounted about four or five feet below.

I have the mast grounded with heavy ground wire clamped to the mast and to a pipe driven into the ground. Reception seems to be ok. I can get my favorite FM station IN STEREO from about 90 miles, and I can certainly pick up signals on my PRO-39 that I could not pick up with either the rubber or whip antenna.

My question is what do I need to do in the way of grounding the antenna cables. The cable for the scanner is 52-ohm and the cable for FM Stereo is 75-ohm.

Please E-mail any ideas. Thank you.

Phil

So here I am , or rather I heard that someone was listening to their
BC2500 for the first time to check it out. Well here the unit gets
turned on, and the first thing out of the speaker is a comment from
the lover to the boyfriend asking him if his wife peformed certain
very specific sexual acts. The conversation was lurid enough to put
up on alt.sex.stories. It resulted in some very interesting feedback
from the wife.

Hi Simon,

How's it going..Interesting review - I'm sure you've wet a few more appetites...

> You can power the set using internal batteries (nicads if preferred)
> or an external 12v dc supply.

This has to be 300Ma or more though if you try to use something
other than the supplied adaptor.

> One thousand memory channels are provided in 20 banks of 50 channels.
> The banks are designated "A" thru "J" and "a" thru "j". The lower
> case memory banks can be password protected. Each memory channel has
> an address like "A00" or "J23" or "b34".

One useful fetaure is that when you want to enter a frequncy into
any channel the radio will prompt you to the next available empty
channel which means you cannot easily overite data. You can
overide this and select any channel at which pount the display
will then show you the frequency and alpha text (if any) of you
chosen channel.

> When you store a frequency in a memory channel you can add a 7
> character comment. The comment helps with identifying channels held

> a character and the step keys to move the cursor backwards and
> forwards on the alphanumeric display.

Or you can go back and edit the alpha text at a later time. It
would be nice if you could clear the alpha text with one key
stroke though. (or have I not read through the book well enough
yet ?)

> RF and scanning performance
> ---------------------------
> Bearing in mind the filter, SSB performance is still quite good on HF
> allowing HF amateur radio and utility signals to be received clearly.
> Frequency stability is excellent through the use of true SSB.

Not as good as the MVT-7100 though in the time I've been playing
with one. I have not really tried on AM brodcast but on USB the '
7100 seems better. The first day I had one I plugged in 4.722KHz (
which is RAF Volment weather)...on the '7100 with a telescopic
antenna is was quite clear although the display show 1.5KHz offset

(Ie 4.273.5'ish), trying the same frequency on the 8000 with the
same antenna - not a tweak. I demod this to a customer yesterday
with the same result.

> There are very few spurious signals from within the radio and strong

Likewise - seems very good in this department.

> Notable features:
> Excellent manual written directly in English (not translated).

Indeed but I think Richard says he rushed a little and although I have not
read it through myself yet one or two people have mentioned it is a little
misjointed but nevertheless its is imeasurably (sp?) better than
anything the Japanese would have put together.

> Range of RS-232 control commands (the best available I have seen).

Can't argue with that - from what I can gather this interface is a
few months away yet - maybe you have some more info in view of you
connections ? I would guess though that to buy the interface & software
would leave you with little change from 150GBP

> Alphanumeric display giving clear easy to read information.

Yup..

> Panoramic (or spectrum) display.
Mmm.....pretty much next to useless though don't you think,
rather like an ashtray on a motorcycle & I think my chocolate
fireguard has more potential !

> Dual VFOs

> Password protecting memory channels.
Nice :-)

> New user and expert modes of operation.
I can see many "owners" hassling their dealer with "I can't get it
to work" screams of help though...arghhhh...

> Copying memory data between radios.

> Inbuilt ferrite rod antenna for MF coverage
There seems to one or two comments re the ferrite - it seems to
have been causing trouble switching in/out automatically which I
assume has been solved although AOR (UK) haven't mentioned this.
I also heard it mentioned is weekend that the ferrite bar may have been
a cause of problems related to the CPU as it is situtaed immediatly
above the CPU within the radio.

As you say it certainly offers plenty of punches but in the 7/10 days
or so I have been playing around with one my overall impression is
that if you shut your eyes and listen to what comes out of the
speaker the MVT-7100 is still the "better radio", yes the AR-8000 is
very good and has many facilities that people will find very
useful but the audio and performanec is just not quite that of a
Yupiteru but I'm sure the extra features will make up that slight
shortcoming for many people.

Does anyone have the frequency for Prime Cable of Chicago?
or perhaps, Chicago Cable or perhaps TCI? Thanks alot!

Source record: 270926

I used to own an ICOM R7000 (sold), and was pretty happy with it.
I've become more serious again about monitoring, and am considering
buying another one.

Several people have told me that they were just as happy with Pro 2006's
as R7000's. I'd like other opinions. I'm well aware of the 7000's
scanning shortcomings and issues around cellular availability. I'd like
head-head comparisons of reception quality - sensitivity, selectivity, etc.

thanks,

Yes. Simply convert the capcode to octal and discard the last digit
of the result (a checksum maybe?).

>If you could still find a 200xlt which would you prefer?

I used to have a 200XLT. Now I have a 220XLT and a 2500XLT. The 220 is a
better scanner than the 200. It has more features, faster scanning, service
search, etc. I think it is slightly more prone to images than the 200XLT, but
not too bad.

During the tragic flooding here in July, my brother-in-law bought a Bearcat BC70XLT that proved to be invaluable. We were able to stay on top of many situations such as rescue attempts, responses, and kept up-to-date with the status of the only road open that led in or out of Americus, GA. Again, the scanner was extremely valuable.

My question is whether or not this particular unit can be modified, and if so how? I can't tell ya'll anything about it since he has the scanner and I have the internet access.
Thanks in advance,
Jim

There are no mods which will allow you to receive the 200 - 400 military
aircraft band on the 100XLT. However, I think Grove now sells a frequency
converter that will let you monitor this range on your scanner.

Yes, I always assumed that the power cord is acting as an antenna.
What you need is merely a longer antenna -- the supplied rubber duck is
not too good for 40-50 MHz. Radio Shaft sells a telescoping antenna
with a BNC mount which I find works OK for the range mentioned. I use
it for monitoring cordless phones.

Be careful -- such things put quite a strain on the scanners BNC mount.
The case can easily be cracked or the connection inside the scanner
can come loose.

WATKINS-JOHNSON HF-1000

****

Sony 2010 - 3

I found it VERY easy to plug in and start listening. The supplied instructions are adequate for what they do, but are not really enough to really start enjoying the radio. The whip antenna works great at home, but just doesn't cut it at work (way too much metal/interference). Even the supplied wire antenna does not seem to help at work (I have not yet tried it at home (no real need).

****
Realistic DX-342 - 1

I've owned this little radio for about a year now and am really pretty happy with it.

Advantages: Size - Measuring approximately 4 3/4 x 2 5/8 x 1, you can take this little mini anywhere! Even slip it into your shirt pocket!
SW bands - Covers 9 SW bands: 49m, 41m, 31m, 25m, 21m, 19m and 16m.
MW, FM, FM Stereo (thru headphones)
Travel Power lock
Push button control
Runs on two AA batteries or AC adapter
Travel pouch
Carrying strap

Disadvantages: It's an analog unit, guys and gals, no digital display.
No back stand
Antenna does not rotate up

I've had a lot of fun with this little receiver. The SW sensitivity is quite good for my area of the country, Cleveland, Ohio. The speaker has a nice sound and improves thru the earphones. FM stereo thru headphones is great! MW DXing is surprisingly good! I can grab signals from Boston, Chicago, New York and Cincinnati much better than on my Magnavox AE 3625 Digital!

Summary: A nice little travel radio that's fun to fiddle with or take for travel when you're in a pinch. Radio Shack has discontinued this model so you might be able to find it on sale for around $50.00. I love the size! Ideal for travel! I'm beginning to think that anything larger is too

cumbersome. I do miss the Digital Display and all the
features that go with it: Freq. display, Alarms,
world time display, etc. If I were buying today, though,
I'd consider what else is out there for just a bit more
money. For example, the new Sangean 606 is only
slightly larger and has all the digital features mentioned above that I miss. I
've seen it priced for as little as
$179.95!

****
Realistic DX-375 - 1

It costs $99.99 though I got it for $89 since I had a coupon for a
rebate. For the price I think I got a good deal. It has digital tuning
and direct input of frequencies which allows tuning to be a pretty
simple job and not a time consuming act of patience. It uses two C type
batteries... I use rechargable ones and they last a pretty long time..

It is not small enough to carry in your shirt pocket but it could fit in
the front or side pocket of an average sized backpack. It is just great
when you are walking back home from school/work ... it can be easily
carried in one hand as you catch up on the news from
BBC/Deutschewelle/Radio Australia/etc.... as you walk home..
I get decent reception of all the `big stations' even indoors and have, on
occasion also been able to tune to Radio UAE....

The sleep function is perfect for someone like me who likes to fall asleep
with music... the FM sound is pretty good in stereo (headphones)... The
AM reception is also fairly good but it has a very high tendency to catch
those Bible bashing stations...probably a reflection of the region where
I live...

The strap is a little shoddy and I have a feeling I may have to `fix it'
soon... I expect it to pop out any moment....
Despite that, I like it...

****
Realistic DX-380 -2

I've owned a DX-380 for about 9 months now and....
It's a GREAT RADIO! However, I should qualify
this. I bought it on sale from Radio Shack for the
bargain price of $129.95! It regularly retails for
$179.95. At $130.00, this radio is a real steal!

About the size of a large paperback book, the 380
is feature packed!

*DUAL CLOCKS
*ALARM WITH RADIO/BUZZER
*60 MINUTE SLEEP TIMER
*DUAL BANDWIDTHS
*DIRECT FREQ. ENTRY TUNING

*TUNING KNOB
*SLEW TUNING
*TUNES IN 1 OR 5 KHZ STEPS
*CLOCK DISPLAYED SEPARATELY
*BACKSTAND
*STEREO THRU HEADPHONES
*CONTINUOUS SW COVERAGE...NO GAPS!
*AUTO SCAN UP OR DOWN
*ANTENNA ROTATES AND SWIVELS
*CARRYING CASE

The sensitivity of this radio is GREAT! With a reel antenna, it's even better! I read another review that said reception was lousy....I think that individual should check his particular receiver as he might have the rare defective unit. MW reception is also outstanding and with a Slect-A-Tenna is greatly improved! Herein Cleveland, I pick up Chicago, Cincinnati, and Pittsburgh during the day WITHOUT the select-a-tenna! With the S-A-T reception gets an added boost! (these are all 50,000 watt stations)

I have found it to be about the perfect travel size. I would like something smaller, like the 606. This size, however is fine. I've carried hardbound books on jets that are larger. The many features makes up for it's slightly larger size over a mini. It does not have SSB, but I really don't miss it.

All in all, A great radio priced at $130.00! I would not have bought it for the price of $179.95. There are other radios in that price range that ive ya more bang for the buck. At $130.00, it's a great deal! If you can get it at that price, snap it up!

I am by no means an expert, but I have a DX-380 and can give some of my experiences. First of all, I would pay the extra to get the 390 to get the single side band capability. I miss it. I miss it. Also, the sensitivity for foreign broadcasts (I'm in DC) without an external antenna is poor. You get the BBC and some German broadcast relays from Canada transmitters, some south american stuff, and that's it. BUT with a 50 m Cu wire out my 2nd story window attached to the antenna with an alligator clip, I regularly get Abu Dhabi and Australia at night.

****
Realistic DX-390 - 2

Great mid-sized digital portable. Good sensitivity and selectivity. Digital display shows time, frequency, signal strength, and memory location. Covers LW (in 9 kHz steps), MW (in 9 or 10 kHz steps) and SW continuously from 150 kHz to 30000 kHz. FM reception (88-108 MHz) with stereo through headphone jack. BFO control for SSB reception. Built-in timer/clock, 9 programmable memory locations per band, except 18 on SW. Good audio output. RF Gain and AM bandwidth controls. Keypad

frequency entry. External antenna, AC-adapter inputs.

A great radio for the beginner or as an upgrade from a smaller and/or analog unit.

Purchased from Radio Shack for $219 in January, 1992.

I have a new Realistic DX-390 (alias Sangean 813??). Seems to be a great value for the price $169 US. I haven't yet heard from someone who can recommend a radio for the same price that is better, and can back it up with facts.

****
Grundig Satellit 700 - 3

Truly a world-class portable, digital receiver. Excellent sensitivity and selectivity. Digital display with two separate clock/timers, signal strength meter, band selection, frequency readout, and user-definable eight-character "name" for each memorized station. Has RDS circuitry on FM to decode the newly-phased-in system for identifying stations by call letters, format, etc. 512 memory positions, upgradable to 2048. Tunes in .1 kHz increments. Selectable wide/narrow bandwidth for AM mode reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry. Receives USB and LSB. Synchonous detector helps pick difficult-to-receive stations out of the crowd. Selectable automatic/manual gain control. Covers LW (150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM (87.5-108 MHz). Excellent audio output, with separate treble and bass controls. Stereo through headphones or external speakers. Line-level out (left and right), external antenna, and 12 VDC-in jacks. Local/DX switch. Built extremely rugged. Multi-national power supply included.

An outstanding performer, and worth the price to a serious SWL or DX'er who requires portability.

Purchased from Universal Radio for $479 in April, 1993.

The Following is a comparison of the SONY ICF-SW77 and the GRUNDIG SATELLIT 700:

Both of the receivers you are looking at are pretty solid. The Sony is slightly smaller and has a somewhat more "finished" feel about it. The Grundig is SOLID with a much better sound. Neither is as good a SW signal receiver as the previous Sony, the '2010 (2001). However, they both have very advanced features; multiple (and in the Grundigs case, expandable) memories with alphanumeric tags so that you have a name as well as a frequency, all sorts of memory grouping and scanning etc. The Grundig has good RDS ident. on it's FM band, but I have a feeling that this isn't used much, if at all, in the US. If you intend to buy second-hand, be very wary of the SW77 - the early version was

pretty flakey. The later version is better but still not as good as the '2010.
I think that the choice comes down to "feel". They are both quite complex to use, but both work as advertised. Try 'em both as they have quite distinct operational methods. If sheer performance on SW is the main point for you, compare them with the Sony ICF2010. You'll buy it and save some loot !
For what it's worth, I tried them both and settled on the Grundig. I have my Satellit 700 in daily use and it's performed without a hitch.

My reasons for the choice were:

1. Performance. The Grudig was much better than the early SW77.
2. Sound. I happen to prefer the slightly bassy Grundig sound to the somewhat sharper Sony.
3. Power. The Grundig takes D cells and can self-charge Nicads in the set, which is how I have it set up. (The SW77 used C cells) They both run down batteries fast. The Sony worse than the Grundig due to it's smaller cells.
4. RDS. I love it and the SW77 doesn't have it.
5. Feel. I like the, I don't know, Germanic solidity and sheer heft of the Satellit. A Satellit with a full load of 4AH Nicads can tip the scales at twice the weight of a SW77. Of course, if drop one on your foot the Sony would be the better bet ! I only use the Grudig about the house. I have a '2010 for the road.

I hope this splurge hasn't clouded the issue for you.

Editor's Note:
I have one of these radios and love it! I sent the following message to someone just after I bought it.

I just recently forked out $500 and bought a Grundig Satalit 700. The sound from the radio is truely impressive! I have always wondered why broadcasters put music on shortwave, because it alway sounded like garbage. However with the 700 I can listen and enjoy the music. The 700 has Bass and Treble controls, which improve the sound quality but the Automatic Gain Control most likely does the most toward improving the sound (I'm not an expert, so this is just a guess!). Anyway my Wife regularly listens to music coming from a 60m band radio station in Guatemala, and can enjoy the sound. However there are some bad points. It is programable, but I have not worked out how to do it yet. Well I tried once and gave up. This is not too bad though, because BBC, Deutche Welle, and about 10 others are stored in a ROM table. And these frequences actual work (i.e. they are the frequencies for North America and NOT Germany).
Also I connected a long wire antenna and found my local AM station on shortwave. I guess the front-end is not good enough to

sort the signals out when coming from a large antenna. But don't worry about this either.
If you only want to listen to the biggies like BBC, Deutche Welle, you won't need an external antenna. I am planning to put a Pre-selector between The Radio and the Antenna, and I think this will cure the problem of AM stations on shortwave and cut out some interference. Finally I recommend this radio to you. I'm sure you will have hours if enjoyment from it.

****
Grundig Satellit 500 - 2

Formerly Grundig's flagship portable SW receiver, this is still an excellent piece of equipment. Excellent sensitivity and selectivity. Digital display with two separate clocks (only one displayed at a time), signal strength meter, frequency readout, and four-character user-definable "name" for each memorized station. 42 memory positions. Tunes to .1 kHz increments. Selectable wide/narrow bandwidth for AM mode reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry. In addition to AM, has three receiving "modes" for LW, MW, and SW: USB, LSB, and "Sync," which should more accurately be described as "fine tuning," as this implementation of synchronous detection operates differently from the Satellit 700 or Sony 2010. Selectable automatic/manual gain control. Covers LW (150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM (87.5-108 MHz).
Excellent audio output, with separate treble and bass controls. Stereo through headphones. Line-level out (mono), external antenna, and 12 VDC-in jacks. Local/DX switch.
Built extremely rugged. Power supply included.

An all-around great performer. Now that it's discontinued, many outlets are selling this unit at close-out prices, making this radio an excellent value for the money.

Purchased from Universal Radio for $379 in December, 1992.

I have a Grundig Satellit 500 and am basically satisfied with it. I miss the 512 memories of 700 and 'SSB clarify' control sometimes.

Yes, its 'sync' is exactly fine tuning in 100 Hz steps. However, it is rather simple to make it work similarly to '700 and '2010, because the detector chip is the same in all three. Only a switch with two pairs of contacts is needed. Another design fault, the excessive distortion in SSB mode, can be partly cured by adding two resistors. For serious DX-ers it may be important that the internal ferrite rod cannot be disabled on MW and LW in both 500 and 700, so the in-house noise may become a problem on these bands.

****
Lowe HF-150 - 1

The Lowe HF-150 (sold by Universal and EEB) is a nice compromise. Similar number of cubic inches as the Sony (different shape), but offering some features of the R8. Also the Lowe is made with a mostly solid alumnum case, which is better than the Sony or the Drake. The Lowe has dual antenna inputs (wire or SO-239), record out, audio out, 12vDC in. It can run off any 12V DC battery. I use 7 aH gelcells which I recharge. The Lowe also takes 8 internal AA nicads *OR* disposable batteries. It will recharge the nicads with a builtin recharger if you plug it into an external power supply. It's a nice semi-portable radio. It has a few ideosyncracies, but you might want to look at it.

****
Lowe HF-225 - 2

I've had an HF-225 for a few years now, and I'm pretty happy with it. I use it mainly for broadcast listening. It's connected to 25m of random wire via a 5m coax run inside the house.

I tried using an ATU to improve the matching between the aerial and the coax, and on some frequencies it gave a (small) improvement in signal strength, but it was such a pain to keep retuning that I gave up using it.

I recently bought a "magnetic longwire balun", and this seems to offer the best of both worlds - improved matching between the wire and the coax, but no retuning necessary. It's rather expensive, though, and it may be that I'd have been just as well off with a home brew transformer on a ferrite ring...

The other potential advantage of an ATU, filtering out of strong signals well away from where you're listening, seems to be completely irrelevant on the HF-225. I've never yet found a case where switching in the attenuator did anything beneficial. The receiver's front end seems to be excellent in this respect.

I've got the sychronous detector option, and I wouldn't be without it. It quite often makes a heavily fading signal quite pleasant to listen to. Pity it doesn't have a selectable sideband option, though - I quite often find myself tuning an AM signal in the LSB or USB modes to try to get rid of an adjacent interfering signal.

Would I buy it again? Yes, unless I decided that I really wanted a receiver which offered a computer interface.

****
Sony SW-1 - 2

I bought an SW1E over a year ago, for listening to broadcast SW and FM at home and while travelling. I like this very small radio

a lot. It is maybe expensive for a portable, but the build
quality is very good, - everything looks and feels right.
Battery life is good, and the set DOES work with NiCads (2*AA)
contrary to the instructions. Reception of broadcast SW is good,
either with the whip or clothes-line antenna. I've never noticed
any big problems from adjacent channels either. As a bonus, FM
stereo reception is good through headphones. Audio quality from
the in-built speaker is fair, but you'll want to use phones for
noisy environments. The only bug with this radio is the memory
capacity - only 10 mems is really not enough to cover ALL of AM
and FM.
Summary - if you want a very small portable, and appreciate high
quality (and can afford it), I would recommend the SW1E. Note the
E, which denotes the SW1 kit without the active antenna and brief
case - these add a lot to the price, and I don't rate the antenna
too highly either.

****
Sony SW-15 - 1

I bought one of these puppies on impulse the other day (at my age you
should give in to the occasional impulse, just so they keep coming).
Cost $85; you could probably do better by shopping the discounters.

Specs:

Dual Conversion Receiver, 6 1/2 x 4 x 1 1/2 inches, 3 AA or 4.5v DC.

Nine Bands:

FM: 76-108 Mhz, 10.7 Mhz IF.

SW: 5.775 -6.425; 6.875-7.525; 9.375-10.025; 11.6.5-12.265; 15.00-15.65
17.50-18.15; 21.325-21.975. 1st IF 10.7 Mhz; 2nd IF 455 Khz.

MW: 530 - 1710 Khz; 455 Khz IF.

Analog Tuning dial, volume control, music/news tone switch, 7 position
SW band selector. FM/MW/SW select buttons double as "on" switches.
"Off" button. "Hold" button to disable "on" (prevents accidental
turnons) Slide rule, multicolumn frequency display. Hand strap,
foldout stand to hold at angle on table, soft carrying case. Basic
shortwave guide. Telescoping antenna. FM/MW/SW "on" and tuning LEDs.
Mono earphone jack.

Subjective Review:

I'm pretty impressed. Sensitivity is up there with the Pomtrex [:-)]
without the "splatter" of strong stations. Analog tuning dial
requires a delicate touch but for me that's part of the fun. Drift
seems nonexistent; you get a station and it keeps it without a lot of
vernier twiddling. MW performance was surprisingly good, as was FM.
I'd recommend it as a starter radio.

****
Sony ICF-5100 - 1

I bought this radio in Kuala Lumpur in 1988, and I'm not sure if it goes by the same model number in other parts of the world. It is a shirt pocket analog tuned radio with coverage from 6MZ to about 21MZ in seven bands. The radio is very rugged and has served me well despite of the physical abuse it has gone through. Because of its small size the speaker is only small and the sound from it it a little tinny, but I used it mainly to receive news in countries without English language news services and in remote areas while camping etc. I recommend this radio to anyone, who considers size the most important factor. Cost was about US$70.

****
Sony ICF-7601 - 2

In some respects this is my favorite radio. No bells no whistles no FM stereo -- just a good solid (feels like a small brick) analogue unit. It covers AM, FM and has 10 SW bands that cover most of the "out of band" frequencies. Band switching on SW is done by a slide on the front of the radio while buttons are used to switch from AM to FM to SW. The dial is accurate to 5 kHz so is very easy to locate a station. I believe that it was simply the best low cost analogue rig out there. It's still around and can be had for well under $100.00. Grab it!!

I have a 7601 also. Most of its weight is from the batteries and the speaker, giving it better tone and volume than smaller, lighter sets.

As with other cheap analog sets, it wasn't very hot out of the box.

If you "super tweek" the 7601, it's pretty good on AM, but no match for a 2010 or Superradio III. Most of the shortwave bands peaked up well, but I never could get 19 meters working right. As with most analog portables, the whip is part of the RF tuned circuit, so one must be careful to duplicate the exact listening conditions when tweeking the radio. Even the presence of headphones will shift the antenna tuning.

Unfortunately the 7601 picks up FM stations at various places on the shortwave bands. If you're far enough away from FM and TV stations you might have room for an R-390.

When going on trips I usually take my SW-1 because of the convenience of the presets and the reception flexibility provided by the active antenna that comes with it.

****
Sony ICF-SW33 - 1

I've owned this radio (SW33) for about 9 months and use it as my "carrying around the house rig." It was purchased to replace a Sony 7601 that now resides on my desk at college (things electronic can grow legs on a college campus). By far the best features of this unit are its convenient size and excellent performance on all bands, AM, SW and FM stereo. Don't get me wrong -- this is not a DX machine on SW but for listening to the major broadcasters, it's excellent.

The single filter selection seems just about right and tuning on SW is in 1 kHz intervals. This at least gives you a "fighting chance" to move away from interference. That's a major improvement over the 5 kHz that many radios in this price range allow. In addition, the dual conversion design on SW keeps image interference at bay - a major plus for a small portable.

The radio does not have a keypad so entering frequencies is a bit clumsy. However, by entering the middle frequency of each of the major SW bands in the 7 memories (5 memories plus 2 timer memories) and slewing up or down from those positions you can get around reasonability fast. The SW bands are changed by a combination of 2 keystrokes.

The sleep control (shuts the radio off after 1 hour) can let you be lulled to sleep and the timer alarm can make sure that you get to work on time (radio shuts down after 2 hours if it is turned on by the timer). Setting the radio alarm is very easy - once you have set the clock, but that frankly, is a pain. The clock function, which works very well (combination world/home time), takes at least 7 distinct steps to set it. Fortunately the clock is fairly accurate (looses about 0.2 sec/day) so you don't have to reset it very often. The lighted dial (stays on for 20 sec at the touch of a button) is a nice touch.

Battery life is excellent contrary to the 1994 Passport to World Band Radio (see below). The radio has a battery "gauge" that is activated at the touch of a button radio and shows in the display as a battery icon with 3, 2, 1 or 0 dots inside of the battery outline. It disappears after about 5 seconds. As soon as the number of dots reaches 0, the radio shuts off immediately. I ran a a series of tests with Radio Shacks Super Alkaline batteries and got the following results: 3 dots showed for 37 hours, then 2 dots showed for an additional 11 hours, and finally 1 dot showed for 3.0 hours for a total of 51 hours. (Radio ran 1.5 to 2.5 hours/day with the volume control set at 1/2 volume most of the time). At $2.89 (plus 5% for tax) for a package of four AA batteries (the radio takes 3), that figures out to 4.5 cents/hour which is excellent. This figure differs greatly from that given in the 1994 Passport (25-30 cents/hour). I have no explaination for the difference but I stand by my test values.

Would I recommend this radio to anyone? If you do a lot of band-scanning, forget it; it will drive you crazy. But at about $140.00 plus shipping (NYC mail-order) it's an excellent "second" radio to carry around for listening to the major broadcasters. I like it!

****
Realistic DX-440 - 2

I have a DX-440 and I think it is a good 'dabble' radio but if I ever get serious I will look for a > $500 table model.

I love this radio! It's my main radio and I use it exclusively at home, moving it from room to room. It really is too large for travel

I've found the sensitivity to be tremendous on SW, MW and FM! Very rarely do I need to attach a clothsline antenna! It has continuous SW coverage, a great sounding speaker, BASS and Treble controls, two bandwidths, great sensitivity, good spurious signal rejection...It has all the features I wanted in a starter radio! I bought it about three years ago on sale for $150.00! I still don't know why Radio Shack discontinued it. If you're looking for a good starter shortwave radio and can still find one laying about at a Radio Shack store priced to move, GRAB IT!

****
DAK DMR-3000 - 1

I bought this radio since they have a 30-day money back guarantee and I did not know if I would like the hobby or the radio. Good points: direct-entry tuning, 36 station memories, fairly small so it is easy to travel with, speaker sound was good, reception was okay, but improved dramatically with the addition of the Radio Shack 23' rollup longwire ($8.95). Bad points: only 5kHz tuning steps, only major broadcast bands tunable (large gaps between bands), selectivity not so good, no fine tuning, no BFO, no SSB or CW, poor FM reception. All in all, not a bad radio of $69.90, however, it left me wanting for more, so I got rid of it.

I have seen a couple of posts asking for a low cost SW receivers. I have recently bought a DAK Model DMR-3000, for just $69.90+$6.00 shipping from DAK - a mail order company. The receiver has a direct access, so you can type in the desired frequency, and a manual / automatic scanning system. It also has a dual time clock with alarm and 'sleep' timer. Unfortunately you can tune only to the commercial frequencies on SW, AM and FM bands. I have to say though that cheapness comes at a price. The first receiver I got was defective so I had to ship it back and ask for a replacement. Now, I received a new one which works very well.

Compared to my Sony ICF-7601 the DAK unit is an insensitive brick. The fancy clock and timer features aren't really worth it. About the only thing nice is the FM Stereo support if you plug in headphones but the FM sensitivity leaves much to be desired as well.

Something else to watch for.... That pretty lettering on the buttons will wear off REAL fast. If you haven't used it much yet you won't see a wear off REAL fast. If you haven't used it much yet you won't see a problem. After you've done some tuning you'll see the pretty arrows disappear from the buttons.

****
Sangean ATS-803A - 1

Since I was now turned on by SWL'ing, I moved up to what most people agree is the best all-around radio for this price. Good points: excellent frequency band coverage (150kHz to 30mHz), fine tuning, good selectivity, BFO for SSB and CW, many scanning options, lots of accessories included, good AM and FM reception. Bad points: way too big to travel with, high battery consumption, synthesizer noise in background all the time, scanning frequently skipped lots of "listenable" stations that I was able to get by manual tuning (what's the use in scanning, then?). I found that adding a longwire antenna only increased interference and noise while not improving the set's scanning sensitivity. Overall, a fairly good radio for the price...

I have a Sangean ATS803A which I love. Comments to quote me on would be that it's an excellent beginner's radio for the price. Although I've heard that the 818 is the "latest and greatest" in this price/performance category. I especially love the full coverage 150kc-30mhz and the (albeit lo tech bfo) SSB capability.

****
Sony ICF-SW20 - 1

I was in dispair when I could not find a decent travel portable for under $200. However, I accidentally crossed paths with a Sony ICF-SW20 on sale (normally $99, on sale for $49.99) at a local store and had to check it out. It is an analogue set, but since I got a 30-day return policy on it, what the heck? Good points: analogue tuning so no problem with confining 5kHz tuning steps, INCREDIBLE SENSITIVITY - this radio blew the DAK and Sangean away with the number of stations I picked up, good selectivity (no fine tuning knob - all you need to do is turn the tuning knob slowly), tiny size (4"w x 3"t x 1"d), small whip antenna (only 18"), addition of Radio Shack rollup longwire increased sensitivity even more, great low price (if I lose it or its gets destroyed, no problem replacing it), tuning bands are wider than the major broadcast bands, so you do get some utilitiy reception as well as WWV, AM and FM are really sensitive while FM goes from 76mHz to 108mHz so I can pick up some TV as well. Bad points: frequencies cover only seven broadcast bands (I can live with that, though), only monaural earphone included (however, you can get a $1.39 mono to stereo headphone plug), no BFO for SSB or CW, no station memories. All

in all, this radio gave me the best price/features/size ratio
of the ones I checked out first-hand. It's a keeper for me!

****
Magnavox 3625 - 1

Finally received my Magnavox 3625! Well, I'm certainly happy I
purchased this little radio. Sure, it's not top shelf, but it's
suitable for travel purposes and gives adequate SW coverage.

Has these features:
Travel Lock
Alarm (beeps, does not turn on radio)
Sleep Timer
9/10 KHz switch - for world travel
12 hour clock (however, when unit is swith to 9 KHz steps 24 hour
clock kicks in)
20 presets - 5 for each band FM, AM, SW1, SW2
Dual time
Auto store - this feature allows the radio to automatically find
the five strongest stations in an area and program
them into the memory of the FM & AM band.
Back stand
Antenna swivels and rotates
Runs on four AA batteries.

Well, the sensitivity is quite good. Steps in 1 KHz increments.
No tuning knob but the slew tuning buttons work just fine. It's
about the size of a paperback book and can be taken anywhere
reasonably well. No carrying strap,
though. The SW coverage is limited but it grabs the major
broadcasters exceptionally well. Example: the 41 meter band is
covered from 7100 to 7300. So if you want to listen to the BBC
on 7325, you're oput of luck.

However, I like to listen to the BBC on 12095 or 15070 European
signals during the day that I cangrab when I attach a long wire.
The 3625 can't tune these freqs. but it can grab 15400 (from
africa) WITHOUT a long wire antenna! I'm pretty impressed.

Bottom line....A GREAT little travel radio for $70.00! Call a
Magnavox outlet if you are interested.

****
Magnavox AE-3805 - 2

Great little digital portable. Good sensitivity, average
selectivity. Covers MW (in 10 kHz steps only), FM (no stereo),
and SW in two "bands": 3200-7300 kHz and 9500-21750 kHz. Built-
in timer/clock (12 hour format only), 5 programmable memory
locations per band. Great for travel use.

Purchased from Damark for $49 in May, 1993.

$50 from Damark closeout -- cheapie category

****
Emerson PSW-4010 - 1

Great analog portable. Good sensitivity and selectivity. Covers
MW, FM (stereo through headphones), and SW in 8 bands (roughly
split out as 13m, 16m, 19m, 25m, 31m, 41m, 49m, and
60/75/90/120m). An excellent travel portable.
This is the same radio as the Sangean SG-789.

Purchased from DAK for $49 in June, 1988.

****
Sony ICF-5900W - 1

Sony ICF-5900W was a good radio in its day, but isn't worth
listing now.

****
Icom IC-R70 - 1

I purchased my R70 in early 1983. It came with a scratched plastic
window for the digital display, which the factory replaced. It is
an extremely sensitive receiver. I installed the FM detector board
option, which is highly useful for Sub-Carrier detection from FM
broadcast receivers in conjuction with the R70's ability to tune
below 100khz without a frequency convertor. The so-called PassBand
Tuning (PBT), in actuality an asymmetrical bandwidth narrowing
control, is very mediocre with the factory 455khz filters. Replacing
the 455Khz ceramic SSB filter with a Fox-Tango FT-44 2.4khz 8-pole
crystal filter (equivolent to the ICOM FL-44) makes the passband
filter work as one would want. The AM 455Khz ceramic filter is junk,
and was replaced with a higher quality "4Khz" ceramic filter from
the long-defunct Radio Plus firm. The actual specs for the 4Khz filter
indicate that it is a slightly asymmetrical filter of 5.6Khz bandwidth,
causing a slight degredation of the "highs" (The original spec is
for a 6Khz bandwidth; the 9Mhz AM filter is a 6-pole device). Inclusion
of both replacement 455Khz filters results in a combined shape factor
of much better than 2:1 on AM or SSB. In addition, the RF amplifier
was enabled for AM broadcast band use, and an MOV was placed across
the AC input for protection against voltage transients. [Actually,
a Transorb would be far better in defending against narrow transients.]
For awhile, I replaced the diode AM detector with a Shottkey diode,
but my ears could detect no difference in distortion, and so the
original AM diode was returned to the circuitry. It's been serviced
once by ICOM for an intermittant problem ($150 ouch). There exists
several modifications to enable selection of the 455Khz SSB filter
whilst in AM mode for additional selectivity.

YORX AM908 - 1

****
Drake R8 - 1

****
Drake SPR-4 - 1

****
Icom R-71A - 2

Eskab & Edvis of Sweden used to offer a Phase-Locked AM (PLAM) detector for the R-70 and later R-71; they also offer a version for the NRD525. I have the R71 version. It is a synchronous detector which allows selection of USB or LSB via the IF filter/BFO offset. The PLAM board phase-locks one of the R71 local oscillators (I forget which one, probably the BFO) to the AM carrier. It contains its own product detector. The lock range is not very large, perhaps +/- 20 Hz. The detector seems to have lower distortion than the ICOM AM detector.

Compared to ECSSB, aside from the advantages of phase-locking the product detector BFO, the PLAM unit also lowers the corner-frequency of ICOM's low-pass audio filter, giving better bass response than normal SSB mode on the R71. I find that this improves the intelligibility of the signal.

The PLAM board piggybacks in the mounting area for the ICOM FM option board; both can coexist. Installation is somewhat difficult, as it involves connecting over a dozen wires to various boards in the R71.

Eskab & Edvis also offered a 4 KHz 2nd IF crystal filter for the R71. This installs fairly easily in place of the narrow CW filter. It is very much better than the stock ICOM 6 kHz bandwidth, which is wide-open until it hits at cheap ceramic filter in the 3rd (455 kHz) IF.

I don't know if Eskab & Edvis still offer the R-71 PLAM and 4 kHz filter. They used to advertise in the WRTH.

Regarding other options: I believe Sherwood Engineering offers an outboard synchronous detector for the R71 as well as other receivers. The Kiwa MAP unit should also be adaptable to the R71.

Also, Dom Moman of Shortwave Horizons publishes a modification manual, which details mods like enabling the preamp on MW, true pass-band tuning, sub-10 Hz RIT, etc.

****
Kenwood R-2000 - 1

****
Kenwood R-5000 - 1

****
Kenwood TS-450-1

I know it's not a reciever, but since it has general coverage,I decided to put it in here.The TS-450S iaN amateur transciever that costs little more than a R-5000,and if you have your ham ticket or are thinking about getting it,may

be worth checking out if you are in the market for a new toy.I'd be willing
to bet the replacement for the 5000 will look just like the 450,just like the
5000 looks like the 450's predacessor,the TS440S.First thing it is EXACTLY
the same size as the 5000/440.Unlike the 5000/440,it has an LCD display that
is unlike any other I've ever seen.It is almost too bright!The brightness
cannot be adjusted,unfortunatly.The 450 recieves in all the standard modes
except for fax.It has a"normal"keypad unlike the 5000 and the aggravating
CW that is producewhen a major button is pressed can be silenced by y
-a simple menuss,you dont have to cut a wire like the 5000he S-Meter
is a bar-graph type that I like but some people dont.It also has an Audio
meter function that kin baffles me.I still dont know what use it is,but it
looks nice!Probably the most notable thing you will observe when using the
450 is the QUIET!It is so quiet,it seems strange the first couple of times you
use it.The AGC is non-defeatable and has a fast/slow toggle.It is the strangest
and slowest AGC I've ever seen,on slow the S-Meter just sits there and then
SLOWLY goes down.On fast,it just isn't quite so slow.It seems to work ok,but is
really odd.The stock filter for AM is a mile wide but you can add the YK88 AM
filter but you wll lose the open slot for the 8.83 ssb filter.I'm not sure,but
the 450 seems to have the same stock am filter the 5000 has.On SSB,it uses one
of the better Murata ceramic filters and is ok but the optional SSB filters are
highly recommended.The audio is FANTASTIC on all modes and if you put one of
the minimus speakers from Radio Shack on it,you will like it a lot.Dont bother
with the Kenwood speakers,the one that goes with the 450 is not too good and is
expensive too!The ergonomics are pretty good,except for the tuning knob,yes
like all the recent vintage Kenwood rigs,IT DOESN'T HAVE A FINGER HOLE!!Why
does Kenwood insist on putting these awful knobs on all the rigs they have made
lately!All in all,it is a very good riever in almost all respects,and since t
it only costs about $100 more than a 5000,it is worth a lookND as a bonus,
the recieve coverage goes up to 40 mhz!If you are into low band scanning,you
will hear things on the 450 you never knew existed on your scanner.If you can
swing the 450's sister model the TS690,you can recieve all the way to 60 mhz.
When the 5000 is put out to pasture,if it's replacement is the 450 without the
transmitter,it will be very tough competition for the other makes.All it needs
is Sync.detection and you really couldn't ask for much more.

****
Japan Radio Company NRD-515

THE all time most user-friendly recieveof recent vintagHas PBT,analog
fine tune,four I.F.bandwiths,AM,LSB,USB,and RTTY modes.There is no squelch
but it really doesnt matter much.Of all the recievers I have owned,or ad over
here to play with,it is the most sensitive in the SSB modeI have the
standard 6 and 2.4 khz filters,and th600 and 300 hz filters whitch are great
for RTTY or CW(if you are truly desparate!)The "protection"diodes have been
removed due to intermod from a local AM station.The reciever's case,front and
back panels are made of Aluminum,no plastic to crack on the 515!The audio in
AM is very bad,almost as bad as the Icom R-71a,but in a different way.The
audio is "fuzzy"out of the speaker jack,but not too bad out of the record jack
but still a little "fuzzy".In the SSB modes,the audio is pretty clear and
doesn't fatigue me like the Icom dos far as thergonomics goes,it's
almost prefect!All the knobs are the right size,the tuning knob is large and

has a nice deep finger hole(Kenwood,are you listening???).The S-meter is big
and easily seen across the room.Dynamic range is very good after the diodes
have been clipped(a one minute operation).The filters all are good quality
and have good shape factors.This was the first "affordable"rig that had a
memory option that was worth something with 24 or 96 channels available.
The NDH-518 I have(96 ch.)is also made totally out of cast and sheet
aluminum and matches the 515's styling.It stores frequency only,unfortunatly,
due to the year it was designeIm guessing.There are lots of these recievers
floating around on the used market for about $600 or so.Universal seems to have
a lot of them passing thrgh the store.

****
Japan Radio Company NRD-525 - 1

This is a great reciever,marred only by bad audio and a hiss that will drive
you bonkers if you have good hearing and a speaker that can put out the highs.
I have had two of these,the first I traded for a sateite setup,and the one I
have now.The newer reciever has mucbetter audio then the first one and lesess
hiss too.Ergonomics are very good MUCH,MUCH better than the Drake
R-8.(IMHO,the Drake is seriously overrated and all the stuff about made in the
U.S.A.is kind of funny cause a LOT of the innards are MADE IN JAPAN!!!)Oh
well,back to the 525,if you are into AM,it's probably not the reciever for you,
but in allthe other modes,it is one of the best consumer grade recievers ever
made.Performance in all modes is basically excellent except fothe audio pr
problem,and stability is rock solid.JRC has only cut a few corners compared
to the 515,probably the ultimate in construction for consumer recievers.
The case is made of very thin sheet metal and the front panel is plastic.The
keys fit loose in the keypad but work ok.The display has four brightness
levels and is very easily read from across the room.The S-Meter is "digital"
and is a floating vertical bar segment that seems to be yellow on some samples,
and green on some others.It is sort of "spastic"and twitched a lot on the
first one I had,but not as much on the seconone.The first 525 I had would
"click" on strong AM signals,but the new one doesn't.The main tuning knob
spins very smoothly and has a nice finger hole.(KENWOOD,WHY DONT YOU LISTEN!!)
All in all, a great reciever.

****
Japan Radio Company NRD-535D - 2

I have been using a NRD-535 for two years and i am very pleased
with it. Although the relative high price makes this a radio
for the serious DXer and maybe not the average Shortwave listener.

The NRD-535 has very good ergonomics. It is very easy to operate
during long listening passes. It has 200 memory channels which comes
in handy for storing interesting frequencies that you want to
check later, or stations that you want to check regulary.

+ side:
On the plus side there is the BWC and the very good sensitivity.
The BWC combined with the PBT makes it possible to make
a station readable that is very close to another station, or

a interfering RTTY transmitter. I find that i mostly uses
the SSB mode and zero tunes the station, and then uses the
BWC and PBT to get the most readable signal. The BWC and
PBT has saved a lot of reports for me. The sensitivity
is excelent. It is among the best in this price class.

- side:
The audio in the built in speaker is mediocre to put it mildly.
A station that you read loud and clear in the earphones can be
inaudible in the built in speaker. The selectivity is not as
good as it could be. The NRD is very sensitive for splatter from
nearby stations, and this can totally drown the station that you
want to listen to. The ECSS option that you can equip your NRD with
is a joke. I have it installed but i NEVER uses it. The only time
you can use the ECSS with any improvement of the signal, is if the
received signal is strong to begin with. Don't waste your money on
the ECSS.

The conclusion is that the NRD-535 is a very good receiver for the
serious DXer but it has some shortcomings. The 535 is much better
than the Icom R-70 that i had before, and i would recommend it to
anyone that asked me. What you might want to do is change the filters
to somewhat sharper filters. That goes for both the 9 MHz and the
455 kHz filters.

****
Yaesu FRG-100 - 1

****
Panasonic RFB-65L - 2

$220 from Universal, EEB, etc. -- my main set, an excellent
portable, many features, nice construction and details.

****
Sony SW-55 - 2

This is my principal radio at the present time (I also have the
Sony ICF-SW33 and the Sony 7601). This rig is an extremely
sophisticated piece of equipment. I especially like the fact
that you can store up to 125 frequencies on 25 electronic pages
that can be named as you wish (by country). Once programed this
is very convenient. The two filter selections are well chosen
(much better than the stock Sony 2010 filters). My use the radio
to copy WEFAX with excellent results attests to its stability
(and that it receives USB and LSB).

The versatile timer/alarm and tape remote feature allow
automatic recording with certain tape recorders (Sony and others)
of up to five times and frequencies in a 24 hour period. I use
this feature all of the time. Audio (stereo on FM) qualitity for
a portable is very good; better I believe than the stock 2010
although as with the 2010, it is improved with a set of external

speakers.

Unlike the 2010, the SW55 does not have synchronous detection.
That's too bad because I believe that if it had this feature it
would blow away
tition. As it stands it is an excellent radio. Most
interference can be eliminated with the narrow filter or moving
away from the interference a bit (the radio is tunable in steps
of 0.1 kHz) so the lack of sd is not critical. I really
believe that Sony did not include it because it would have then
had a very negative impact on sales of the SW77.

Would I buy this radio again. You bet! The only problem I've had
in the year an
owned it is that the lettering has worn off the 1, 5, 0 and EXE
keys on the keypad. That should not happen on a $300.00 radio!

I just got a SW-55 for Christmas and find it to be an outstanding radio. Now that I've said that, you should know that I am new to all of this "DX-ing" (is that how you say it?). However, I can tell you that it's reception with the built-in antenna and with the included auxiliary antenna is very good. I found that the radio comes pre-programmed with a number of stations (BBC, Radio Moscow, etc.) and they come in great.

As for your questions, I've found the speaker in the SW-55 to be very high quality, delivering plenty of volume and good sound. There are several "tone" switches (news vs. music setting, etc.) that enhance the reception and its sound. And, the unit is packaged well for travel.

The radio itself has several nice features (I don't know how they compare to other radios since I didn't comparison shop). There are several output jacks that make it easy to connect to external speakers, tape recorders, headphones, etc. There are local/long distance antenna settings. There are lots of ways to set and look at the time (local, UTC, Daylight savings, etc.) There are alarms and sleep settings (for on the road).

The tuning portion is quite nice. The radio of course offers digital tuning (punching numbers in to get to a freq.). But I find that I often use the "analog" tuning dial as well to either fine tune a station or to see what else is out there.

Best of all, the unit is packaged well. As a new user, I have enjoyed the little things Sony has done to make this experience a good one for the new user. Everything from the documentation to the carrying case has made it quick and easy for me to start listening to short wave. Included is a book that is a publishing of all the various countries broadcasting, with their freqs and times. (I gather that these things change quite a bit, but I presume that Sony updates it often)

****
Philips AE3905 - 1

In short, in my experience, the AE3905 is no real great shakes. It looks neat as hell, and marks its owner as a man of taste and distinction with more money than brains (like I said, *I* have one). Its shortwave performance is mediocre. Using this in a hotel last February, I found that attaching the included reel antenna caused the radio to overload fairly badly. The batteries don't last very long. The filters included are fair, but you still get a fair amount of interference from adjacent stations (not as bad as some small portables, but not good). I certainly wouldn't want to use this as my primary radio. For portability, it's fantastic. I can listen to the BBC or VoA anywhere. The radio fits in my shirt pocket, although reception in my pocket isn't all that good. In short, the radio isn't worth what Philips charges for it, but if you've got more money than you know what to do with and a desire to have a flashy looking toy, it'll do. The radio has only recently been available in small quantities in the U.S., and appears to have been discontinued in Europe. I got a reconditioned copy for $179 from the Magnavox factory outlet in Kentucky. Universal lists the radio in their catalog for something like $250 new if I recall correctly. You're not likely to find it anywhere else.

****
WATKINS-JOHNSON HF-1000 HF RECEIVER

I will be doing a lot of comparisons to my other receiver, an NRD-525. To give a basis for comparison, the NRD-525 has been upgraded by the following modifications:

ESKA PLAM board with four added filters following the IF strip
Installation of ESKA Aux filter in the NRD Aux position
Installation of the JRC 1.8 KHz filter in the Narrow position
Replacement of RF chokes on the filter board with shielded units
ESKA agc modification

These modifications have improved the shape factor on the NRD's filters from an average of 2.0:1 to 1.7:1 (60:6 dB). The ultimate rejection has improved from about -60 dB to -75 dB. These modifications are noticeable in on the air listening tests. The NRD hiss has been removed.

About two months ago, I bought another receiver, a Watkins-Johnson HF-1000. I didn't really think this receiver would be much better than the NRD, and I intended to return it if this was the case. I was wrong. The Watkins-Johnson receiver is clearly superior to the NRD in on the air listening tests, almost in every case. In rare cases it is a tie. The comparisons are done using an A/B switch that switches both the RF and audio lines so that comparisons can be made quickly on the same signal. Comparisons were all done in ECSS mode with the receiver settings made as close as possible to each other.

I also did some bench testing of both receivers, and the numbers that the tests give are not all that much different for both receivers, with the exception of filter shape factor. The HF-1000 shape factors run about

1.1:1 (60:6 dB). This does not explain the main difference between the comparisons, however. The HF-1000 seems to be superior in pulling out weak signals. I have heard many signals that are muddled and hard to understand on the NRD-525 sound sharp and clear on the HF-1000. Several other points:

AGC: The digitally processed AGC on the HF-1000 is far superior to the analog AGC on the NRD, even with the ESKA kit installed.
Notch filter: Again, the digital IF notch filter is superior.
Audio: The NRD audio has always sounded low frequency and mushy; audio on the HF-1000 is crisp and clear. This is an important item.
Operating: I like the controls on the HF-1000. They are flexible, yet easy to use. The set is a pleasure to operate.
Synthesizer spikes: The NRD has a synthesizer spike every 100 KHz. While these are not all that strong, some of them fall on inconvenient frequencies, like the propagation beacons on 14100 KHz. There are a few spikes on the HF-1000 at even 2 MHz points.

The only shortcomings in the HF-1000 I've noticed are the lack of synchronous detection (this is supposed to be sent out as an upgrade chip later), and IF passband tuning would be useful in the SSB modes. It is present in CW.

As you have probably guessed, I'm real happy with this receiver. I think it will be the last one I will have to buy for quite a while.

Watkins-Johnson HF-1000 Review Part 2

Watkins-Johnson SAM option for HF-1000

Recently I received the firmware for installing Synchronous AM (SAM) detection in my HF-1000 receiver. I was able to install it in about 1/2 hour and it worked great. In testing it I compared it to the ESKA phase lock AM board installed in my NRD-525. Here are the results for strong and weak signals:

Parameter	ESKA+NRD	HF-1000+SAM
Weak signal lock range	+- 20 Hz	+-250 Hz
Strong sig lock range	+- 40 Hz	+-900 Hz

As an on-the-air test I tried to lock onto Radio Pyongyang, 13760 KHz at 1300 UTC. The signal was weak and fading rapidly at 1300 UTC and was being broadcast on 13760.1 KHz. The HF-1000 was able to lock it immediately even when set to 13760.000. NRD was not able to lock it at all, even when set to 13760.1. Impressive!

Another modification in the new firmware is a change in the AGC function. It is now possible to set three decay rates from the front panel for each AGC setting, Fast, Medium and Slow. In addition it is possible to allow the manual gain setting to control the AGC threshold while in AGC mode. This is a great help for the AGC control. I spent many hours trying to get the AGC decay rates correct on my NRD receiver, and was never happy with that AGC. This required pulling out the IF board, replacing some of

the SMDs, putting it all back together, and then trying it. Digital AGC processing on the HF-1000 makes this a snap, taking only a few seconds.

After several months of using this new mode of reception, it is the one I nearly always use for SWLing and DXing. For weak AM signals it is hard to beat. If the signal is readable at all, it will be able to lock on it. By using both sidebands, you end up with a better signal to noise ratio than with only one sideband. The HF-1000 is even more impressive now with this addition. The only times that I have had to resort to ECSS on AM signals is when there is interference on one sideband. Watkins-Johnson reports that they will have single sideband SAM in the future which will get around this. There are several other options that they are working on, one of which is a plug in board for PC processing. I assume this will have real time spectrum analysis and memory functions built in.

****
AR3000 - 1 (More Info is Available by e-mail from (jlloyd@cs.clemson.edu)

My general impression, is that this is anyhow a very good apparate. It offers continuous coverage 0.1 : 2036 Mhz, all mode, RS232 interfacing, quite good operating commands, triple conversion, 400 memories; it is very compact (small tabletop, 1.2 Kg.), semi-portable; its 13 auto-selected front-end band filters reduce to some extent unavoidable intermodulation. In general, this set offers a self contained and very well balanced compromise of a lot of different demanding features, but will show its best when fully interfaced.

Its price, here in Italy, has been varying greatly during the years. Therefore I cannot say how it really competes with the choice of HF receiver + scanner setup. It is still unclear to me how far is the AR3000 from dedicated traffic receivers.

I'm finding a number of defects and "whish it was" that I'm going to list (I would like to hear comments about), but perhaps I'm just pretending too much from a receiver in which something had to be traded off between versatility and performance. Please note that I have a 4 years old AR3000; some defects could have been amelio-rated in the 3000A, or may eventually be specific of my unit.

Hardware limits:

-AM selectivity is mediocre (approx 10 khz bandwidth). I feel the lack of a variable Am bandwidth. SWL in crowded bands is too often spoiled by the 5Khz whistle. Thinking it was a problem of i.f. detuning, I once sent it to the service to have it retuned, but with no perceivable gain.

-In AM I do experience blocking. A strong transmitter mutes any weaker adjacent signal lying some -+30 khz apart. I suspect this may be rather a problem of AGC voltage (see below on squelch), because the feedback signal is obtained from the previous to the last i.f. stage, which may have a larger than necessary (for AM) bandwidth.

-The squelch control (essential in search mode) is not very functional.
On my set almost everything passes for knob positions below .3 and
only >S6 passes when I increase to .5. It may be a problem of adjustment,
but also reflect the inaccurate behaviour of the S-meter, which (I have
no measurements to support) seems not properly logarithmic. I have
the impression that weak signals give a high S readout when close to
stronger ones, because the S-meter averages on a larger bandwidth than
the demodulator.
Also, the squelch just mutes the a.f. output, but not the line out signal.

-The internal speaker fidelity is scarce. No tone controls exist. Clarity
improves a lot when connected to an external speaker or lineout. No
noise reduction circuitry is present. External audio equalization does
a lot, but of course is not the cure for low selectivity.

-There is no i.f. direct output for say a spectrum analyzer or a different
demodulator (say wide band AM for satellite or TV, stereo FM decoder,
sinchro SB AM decoder). A modify could be to buffer it to a backpanel
jack.

-Intermodulation IS present. I live very close to power MW transmitter,
and in the times they're on the whole band .5 : 2.5 Mhz is unusable,
with crosstalk on every possible combination of transmitter frequencies.
At evening I sometimes hear sw bc stations crosstalks on 20 : 30 Mhz, even
with a short random wire antenna. However, I don't hear crosstalk due
to FM transmitters, which are also close to my place. The 13 front
end filters seem to do their job, since strong signals don't cause
crosstalk out of their respective preselector bands.

-I'm not very satisfied with the small and clicking rotary tuning control. In
the AR3000a it has been replaced with a (I guess optically encoded) smooth
one. I would rather appreciate a jog-shuttle like the one on VCRs, and the mod
itself seems quite easy too.
The tuning is however digital, and stepping frequency causes clicks, which
eventually trigger the squelch threshold during search. The final a.f. is
briefly muted while stepping, but I prefer the line-out signal which is
unaffected and thus has a faster response.

-There is a single antenna input for the entire range. I think this however is
correct, because whichever choice on different antennas is entirely dependent
on the user setup, and should be rather left to an externally programmed
antenna switch.

-Some digital RFI is generated, expecially in the high HF and low VHF. A real
antenna connected with a shielded cable and a good earth however wash it out.

-Some small change in sensivity and background noise can be perceived when
passing across one of the 13 band boundaries (by the way, they are 0.1-0.5,
0.5-2.5, 2.5-10, 10-30, 30-50, 50-108, 108-136, 136-174, 174-224, 224-335,
335-500, 500-940, 940-2036 Mhz), but this is unavoidable, and also due to
the change of the superetherodyne scheme.

Software limitations:

-Scanning is already very versatile for such a small machine. However, auto memory storage of catched frequencies was forgotten. Also, the oddities in the S-metering (see above) impose manual choice when scanning non regularly channellized bands.

-There is a priority channel lookup feature, but the attention threshold has to be the current squelch position. Apparently (see //ftp.funet.fi/pub/dx/receivers/mods/aor300.mod) in the 3000a a programmable lookup time was implemented, but it is not present on the 3000.

-The mode and the tuning step change are set with several keystrokes. I feel it quite tricky, expecially considering that I generally have to switch quickly between 50 Hz/SSB, 500Hz/Am, 1.25 Khz/nfm, 50 Khz/WFM. The step x10 command is very useful, but not enough.

Since the S-meter signal is output on the RS232, and the unit may be fully remotely commanded, all this limits can be cleverly threspassed by an external control software, thought.

I have experienced problems with the 232 interface. The cpu goes crazy very easily when the connector is plugged in/out, unless the "remote" switch on pin 7 is previously operated. This is (I understand) the reason why it was added on the 3000a. When the cpu goes on the moon, one generally has to open the set and to push the reset button (backside of the keyboard), losing all the memories .
Also, I cannot interface the scanner with an Atari St, either because the TTL level Txdata is to low for that serial port or because the continuous output of the S-meter simply is too fast for the Atari bios.
Passing by, note that the RS232 speed can be set to 9600 baud with a switch on the cpu board.

I agree with you, I had the same experience a couple months ago.
Choppers and cops everywhere, and dead silence on my scanner. I wish I
had my gun then, it turn out to be an attempted breaking across the
street.

: reception when running under battery power. Any ideas? Thanks!
:
:
: Bob Cormier
: rcormier@mitre.org

Mine has the same behavior. I would expect the power out of the adapter
to be floating. Therefore, you are not getting a better DC ground. One thought
is that we may be experiencing the result of a better "ground plane". A
vertical antenna can be considered in a very vague way a dipole. A
normal base station antenna will have a visible ground plane either
in the form of radial leads for roof mounted antennas or in the case
of my shortwave antenna the earth ground itself. It is most probable that
one side of the power lead hooks directly to the ground side of the
antenna and and acts like a ground radial. One experiment you might
try(or I might when I get a chance) is to hook a wire directly to the
outer part of the antenna connector when on battery power and see if the
reception is improved.

>life?)

You should have said so. The net is a great place to have an
interesting discussion.

I don't understand your second statement.

>I guess books that you can buy from a STORE are all written by the clergy or by
>your well known family members? In addition, there are of course no technical
>people on this net right?

I don't agree with your statement about books that you can buy from a
[store]. There are many that are not written by my family members,
and I don't recall ever seeing an antenna book written by the clergy.
I also don't agree with your statement about there not being any
technical people on this net. There are a lot of us on this net. But
generally when people ask for free advice, it is without stipulations
such as yours.

For example, if I posted something like this:

"Could someone give me an alphabetically-sorted list of English
words and their meanings, but don't tell me to go read the dictionary"

...wouldn't I sound stupid?

Now go re-read your original post, you chowderhead.

This should get your started:

a or A (a) n., pl. a's or A's. 1. The first letter of the modern
English alphabet. 2. Any of the speech sounds represented by the
letter a. 3. Something shaped like the letter A. 4. The first in a
series. 5. The best or highest in quality or rank: grade A milk. 6. a.
The sixth tone in the scale of C major but you wouldn't even read it
if someone even spelled it out for you, Brad, or the first note in the
related minor scale. b. The key or scale in which A is the tonic. c.
A written or printed note representing this tone. d. A string, key, or
pipe tuned to the pitch of this tone.

: 1. About $600
: 2. When the FCC approves it.
3. I think 449 pounds (UK), orders are being accepted. Visa(also known
as Barclaycard) and MasterCard(also known as Access) accepted. You
receive better exchange rate if you use a charge card.
4. As soon as Javiation UK starts receiving them. Delivery is via UPS
International (Red). No vat taxes, but there are import duties.
My experiences show this is typically two-three day delivery. If it is
shipped on a Friday, you may actually see it on a Monday!
5. Javiation offers the no quibble 1 year warranty and full INTERNATIONAL
version (nothing removed). EBB/EDCO can not beat that, maybe they should
open an office in a foreign port -- then they could offer the same.
6. FCC approval not required for units not purchased for resale purposes.

Several folks on this group have asked a question about overhearing mention of illegal activity while (illegally) monitoring the cellular band. Now, I am not a lawyer but I do have a BS degree in Criminal Justice and I know a little about the law. When I first read this question, I remember back to my college days and having read a section in one of my case law books. Also, let me point out that this book is copyright is 1975 and the case involved was in 1921. So, things may have changed since.

The following was taken from: "The Law Of Arrest, Search & Seizure." written by J. Shane Creamer.

"If a private person steals or illegally seizes incriminating evidence from someone and turns it over to the police, that evidence is admissible against the accused so long as the police did not in any way participate in the illegal seizure of the evidence. Burdeau vs. McDowell, 256 U.S. 465 (1921). Citizens, private detectives, store detectives, security guards, and all other persons who are not connected with any official agency of government are not under the strictures of the Fourth Amendment because the Supreme Court of the U.S. has indicated that this amendment protects the citizen from illegal conduct by government officials only. If a citizen is wronged by another private citizen , his remedy is to sue civilly."

>:
>
>Mine has the same behavior.

Mine also has the same behavior. Even with a discone attached when
battery operated, AC operated works better with just the ducky on 46mhz.

I measured the voltage on the AC adapter when loaded with a PRO43,
it measured 11.5v !!! Luckily, it didn't hurt the PRO43. These things are
not regulated, and the higher amp rating you get the higher the output
voltage is to make up for resistance drops. Mine is rated at 400ma.
I'm going to put a 7809 to regulate it to exactly 9v and see how it does.

Anyway, I believe that the higher AC adapter voltage (9-11.5v) makes the
circuitry sensitivity much better than the low voltage batteries (8-9v).

Seriously though, Brad, I think what happened was that your original
post didn't accurately convey what you were thinking or requesting. I
understand better now what you were asking, and maybe it would be a good
time to re-define what you are trying to do.

Are you intending to listen to cordless phones? Does your antenna need
to be portable (i.e., do you want to hold a scanner in one hand and
the antenna in the other as you walk through the neighborhood, or is
it something that goes up on the chimney/balcony/TV mast)? Does it
need to be rotated? How narrow does the forward lobe need to be?
Will you be transmitting?

132. Log-yagi for 50mhz

Newsgroup: rec.radio.scanner
Date: 1994-08-03 19:35:03 UTC
From: magnet@nRCHs022
Message-ID: <31orh7$p8i@corpgate.rich.nt.com>
Source record: 270949

I think I have found a good directional antenna for 46-50 mhz. The antenna comprises the characteristic of both the log periodic with the yagi. One aspect of the antenna is it's reception differential front to back and it has a slight size advantage. If anyone is interested I can email the plans. The antenna looks like this:

Not to scale.

```
| | | | | |
| | | | | |
| | | | | |
| | | | | |
| | B A | |
-----------------------------------------------
| | A M B | |
| | | A | | |
| | | S | | |
| | | T | | |
| | | x | | |
x
x
x
x
x
x
```

The "A" and "B" represent the phase of the driven elements.
Materials are wood, electro-magnetic tubing, etc.

>a SoundBlaster card for this...HHMMMMMMM???

If someone out there can tell me where to get the specs on the data
stream used on cellular control channels, I'd be more than happy to try to
work out a program to read such data. At present, I have no callular-capable
receiver, however, so I suppose I'd need some sort of "raw data" to test it
with, too, but let's deal with first things first.

I don't think this sort of thing should be TOO terribly difficult. I
managed to use Count Zero's article in Phrack on the encoding of magnetic
strips to make a reader out of my sound card. I hooked the reader's head
straight into the microphone input of the card with NO signal conditioning
whatsoever, and did all the work in software. Lo 'n' behold, it worked. Go
figure. Heh... It was a bit clunky, as there was only a narrow range of
microphone volume levels that worked properly, and the sound file had to be
converted to a raw format first (SOX fos DOS can accomplish this), but it
DID work, and I was able to read all the cards I ran through it. It only
read the middle track (the one with the low bpi recording density), but I
imagine that could be changed, too.

So anyway, if anyone wants to throw the cellular data specs my way,
or tell me where to find them, I'll look 'em over and consider taking a
crack at the problem.

sjking@freenet2.scri.fsu.edu (Steven J. King) writes:
:
: Although I think the federal law prohibiting receiving unsrambled FM
: frequencies on the cellular phone band and state laws (California)
: prohibiting receiving unscramled FM signals on the cordless phone band
: are immoral and impractical, there are two issues: business and
: residential. I am not experienced with the business side, e.g., HBO
: in pre-scrambled days, but if a business' product is contained in the
: RF signal then receiving that signal without permission (or
: descramling an encrypted signal especially) would be like stealing a
: can of beans from Albertsons.

Bah. Only if the signal was on cable. If it was from a satellite, it
would no more be stealing than if Albertsons' threw the cans of beans
on your lawn, and then tried to accuse you of theft - when you picked
them up for your own use.

: As for the issue of listening to the phone company's microwave links,
: that should be illegal because of the phone customer's reasonable
: expectation of privacy. If you use your landline telephone, you
: should be able to expect that your call will be private (unless the
: FBI is out to get you or the President doesn't like you). If you use
: an unencrypted cell phone or cordless phone, you should not have any
: expectation for privacy since your conversation is sent out into the
: ether for everyone with basic radio equipment can hear you. If the
: signal is encrypted, that is another thing. If it is encrypted, there
: is some level of privacy but not as much as using a normal phone.

If it is properly encrypted, there is far more privacy than with a normal
phone.

: The problem with current scanner laws is that they artificially
: creating a sense of security on VERY UNSECURE modes of communication.
: They are equivalent to, IMHO, making it illegal to listen if your
: neighbors talk to each other with bullhorns.

Exactly.

Unfortunately my usenet software doesn't space characters in a way that makes this look like anything. Can someone tell me if Brad typed out something that looked like a yagi? It appears that he was asking this after reading my post, but I can't answer the question. Sorry.

A yagi and an LPDA may look a lot alike at a quick glance. LPDAs aren't always mounted on horizontal booms. I have used one on HF that was made of wire suspended between telephone poles. There are a number of ways to make them.

Source record: 270969

Here in NYC, the police choppers are almost constantly on
SOD 1 (Special Ops Division Channel 1).

As far as CG goes, though, I visited North Carolina's
Outer Banks earlier this year and was awaken to a rumbling
house by one of the big daddies flying so low over the house,
I could see the rivets on the belly. I entered all marine and
coast guard freqs from my Monitor America as fast as my fingers
could go and all I got out of it was a loop tape saying, "all boaters
be advised that the Coast Guard will be performing a simulation
rescue exercise in Currituck County from 10 hundred hours until
12 hundred hours on this date. Coast Guard out."

I know when I visited L.A. in May, someone was kind enough to
make scanman10.exe ftp'able for those of us that wanted it, and
it really came in handy. If anyone still has it in near-online
condition, perhaps they could repeat the gesture? My copy is
at home and I won't be there until this weekend.

The opposite of the thread's question is fun to do: use a cordless phone
and make up a fictitious major 'crime' like a major drug deal, murder,
child molestation, etc. and give specific instructions on the address.

Then carefully observe from a distance who shows up...

: Now someone will say "old catalog".
:
: Ok, for that person I will say Monitoring Times, August 1994,
: See page 77 for details. All the same devices as described above.
: These devices are supposedly illegal to market in the U.S.
:
: Is that current enough advertising?
:
: This is a good example those converters that are banned, so much for
: the ban -- on kits or otherwise!

So what? Such advertisements prove nothing. One possibility is that the kits were made up - before the ban went into effect. If so, then they are perfectly legal to sell. A second possibility is that Ramsey has chosen to ignore the ban - until they are told explicitly to stop.

: : The FCC has said that the simple adding or removing a component is NOT
: : sufficient to disable cellular frequencies - that would be "easy conversion".
: : Now, if that component was a surface mount 20+ pin chip, then it would most
: : likely be sufficient. Changing that would not be easy for the average person.
: Yes, but to modify it here -- I'd expect it to be something simple
: not needing to be done at the factory. Additionally, a new approach
: is to buy it here, like a Pro-43 and order the UK version of the
: digital board. Don't bother with the SMD components, just replace the
: whole digital board (it contains the CPU, diodes, not much else, could
: not cost much more than the CPU would). As a replacement board, it
: would do the job.

This has not been tested in court. I personally feel it would be legal, but it may not be. It certainly would be trivial for the FCC to change their regulations, if they felt that the practice was becoming common enough to worry about.

: : : Remember, kits and parts are EXEMPT from the law. Not addressed once.
:

: : See above.
:
: Yes, I agree, SEE ABOVE, Ramsey has no problem selling converters
: and speech inversion descramblers. I sure don't see what anyone
: else has to worry about (regarding imports and such!)

I commented on the possibilities above.

It was illegal to manufacture or import radios capable of listening to the cellular frequencies starting in April - you are a bit behind the times. It is not illegal to modify a radio to have cellular capabilities - nor will it be illegal this fall.

: law against
: listening was aimed primarily at police. ie: anything they heard could
: not be used
: in court, and if they had information that could only had been obtained
: via cellphone, any evidence could be excluded. If you own a receiver
: which can re-
: ceive cellular, have a good time, but don't divulge what you hear! The
: original communications act (sec. 602) allows anyone to listen to any
: frequency, but can not divulge contents. This section was pre-emptepted
: by the Communications
: and Privacy Act of 1989.

Wrong. The law was aimed at the general population who owned scanners, as people found out that the Cellular Providers were lying when they said that their conversations were secure. Now, they simply lie by stating that it is illegal to sell a scanner that can monitor cellular frequencies - and thus implying that no one will be able to listen.

The law was never aimed at the police - who already had restrictions on what could be used in court.

I just bought a pro-43. I have yet to attempt to modify it. If you (or
someone) will send me info on the mod, I will attempt it and relay any
info. From what I understand, the high SN and lack of 'A' 's indicates it
is probably possible. A RS employee could tell us more. (even going
through all of the 43's in stock and checking the serial #'s

I presently have an Austin Condor antenna. I was thinking about getting either or both of an discone or all band antenna, specifically I have heard the Diamond and Grove antennas are pretty good. I am wondering what models do they make for both. Can anyone help me? I also want to know if I should order direct or is there a good store in SF Area that I can buy them from. Also, I have read some stuff about Intermod, is that signals going through the case? Is there a way to cut down on this. Any help would be appreciated. You can either E-mail or post to this group. Thank You.

I'm not absolutely sure but...
The antenna cables are already grounded. They have the same ground as
the antennas.

Please correct me if I'm wrong.

This just happened to me today -- turned on the scanner after seeing
an officer speed by with sirens blaring.

They had helicopter assistance in finding a suspect. I could hear the
helicopter on the normal police frequency, along with the ground units.

156. Best hand-held scanner?

Newsgroup: rec.radio.scanner
Date: 1994-08-04 06:05:12 UTC
From: kgk@sig.sig.ai.mit.edu
Message-ID: <KGK.94Aug4020512@sig.sig.ai.mit.edu>
Source record: 270946

I was wondering what the "best" hand-held scanner is, if price is not an object. (I'm sure that I am unable to afford it, but I am curious.) Of course, there are many issues to consider for "best," but they would include, perhaps in order:

-> low intermod
-> good sensitivity
-> very large frequency range with no holes (50kHz to 1.4GHz?)
-> AM, FM, WFM, ... (the more the better)
-> good physical design (metal belt clips, solid buttons, reasonable resistance to water, high quality BNC connector, and so forth, and possibly tasteful button design/placement).
-> the ability to label frequencies/bands with an alphanumeric label
-> compact size
-> nice speaker
-> computer interface
-> fast scanning
-> lots of channels

I've only seen the Icom R1 and the Pro 43, both which come up short. The AOR8000 sounds very exciting. Jonathan Clough mentioned the Yupiteru MVT-7100, which he seems to prefer to the AOR8000. Are there any other radios that should be added to this list?

158. Best Scanner under $250

Newsgroup: rec.radio.scanner
Date: 1994-08-04 07:33:39 UTC
From: cschmidt@diralect.me.pvamu.edu
Message-ID: <31q5kj$f3k@news.tamu.edu>
Source record: 270950

I am not new to scanners, as I worked for Radio Shack for a year
and loved to play with the scanners. I was able to listen to 800 Mhz
Cell-phone Conversations with the units in the store. Now this was from the
period from June 93' to May 94'. When did the Manufacturing change, or could
there be some phones that are transmitting out of band that are older or
something?

I liked the Pro-43, I believe that is the one that is 100 channel
with 800 Mhz, HyperScan, The Light Button that makes the light STAY ON, and
the display is at the top of the case (not where controls ae located) just
above the speaker, and it is a rather large display, I liked that model when
they first introduced it and played with it the most. It often (every 3-4
months) would go on sale for $189 vs. the $229 regular price. I used some
of the other but didn't really like em'.

Radio Shacks Scanner used to be made by Uniden Corp., are they still?
What does BearCat offer that is similar? I have not ever used a scanner
made by anyone but Radio Shack so I don't really know what else is
out there.

A customer that had purchased a PRO-43 from me later came in with
a little Icom Handheld (very small) that scanned from 1 Mhz clear up to
? Ghz. with no gaps in between. He said he bought it at a Ham Convention
and paid like $400 for it. What was that thing, have you all seen or
owned one? Little outta my price range but just checking.

I currently have a Pro-33 HH scanner that I paid $5.00 for. A
customer brought it in 2 Years after he bought it and he had the Three Year
" Unconditional " Warranty on. WEll, the Manger gave him the One Discontinued
one we had left to replace it (Yes, Replace) and then illeagally, I think,
sold the Broken one to me (used to be employee, was employee at time) for
a measly $5.00! Don't tell anyone though. Hah! It works fine except the
piece of copper that make the contact on the Board for the Keylock switch
is missing, so the Keylock doesn't work, but for $5.00!

It is a 20 Channel 30-512 rig with a bunch of gaps. I want to
purchase a Modifyable 800 Scanner under $250 that will last me a while
even after all those mods. Give me some info on all Brands.

Thanx,,,

Chris

Manuals for all Radio Shack equipment are available from:

Tandy National Parts
900 E. Northside Dr.
Fort Worth TX 76102
(800) 442-2425
=> (817) 870-5600 (calling from outside the US)

Give them the catalogue number of the PRO-2006 (20-145) and ask for the Service Manual. It should cost ~US$7.

You might also try InterTAN's European headquarters to see if they offer a similar service (they operate Radio Shack outside the US).

InterTAN
Parc Industriel de Naninne
5140 Naninne (Namur)
Belgium

(If someone does contact InterTAN, please tell me the phone number and if they have a parts service. I've been giving out this address for several years, but no one has written back to confirm it).

>Thank you in advance.

I have the same speaker and had the same problems until performing the mod
that restores full audio power to the earphone jack. With the radio face-
down and the back removed, solder a wire from the left side conductor of
the earphone jack to the metal strip running across the top, just above the
earphone jack. This, of course, depends on whether or not you feel
comfortable poking around the innards of an expensive radio, since it
involves cutting some of the plastic of the earphone jack away to expose the
metal, and it's a tight area to work in. At best, a little work allows you
to use what you've already bought without the extra expense of buying an
amplified speaker and batteries. At worst, your radio might need repair
or replacement.

Margaret McCurdie was having problems with her Pro 2006 batteries running low...

Before you bring it in, Margaret, check the battery to make sure that the terminals are tightly on the battery caps. With my NEW 2006 I noticed that the larger terminal kept slipping off the battery, which would cause the "battery low" light to flash. I solved (sort of) the problem by tightening (gently!) the terminal with a wrench, and the problem has not recurred. God knows what's going to happen when I have to take the thing off, though! :)

|this look like anything. Can someone tell me if Brad typed out something that
|looked like a yagi? It appears that he was asking this after reading my post,
|but I can't answer the question. Sorry.

|A yagi and an LPDA may look a lot alike at a quick glance. LPDAs aren't
|always mounted on horizontal booms. I have used one on HF that was made of
|wire suspended between telephone poles. There are a number of ways to make
|them.

Curtis,

The picture was not of a yagi. I went to Tuckers yesterday and looked at about
10 different books on antenas most of them ARRL. I was suprised that there
were extensive technical written discriptions but no pictures or drawings
of the antenna. I found another group of books which did have drawings and
pictures along with the dimmentions and contruction plans in addition to the
propagation plots and theory.

I am going to try to build a "log-yag". I let you know how it goes. The antenna
is mounted on the vertical, not horizontal.

Thanks for your assistance, Curtis.

Worked for me. Police pulled me over on normal random DWI raod check, saw
my 2M rig and asked if it could receive police signals. I said all I know
is that it's a ham rig and gave him the manual to see if it can be done.
He gave me the manual back and told me to get going. A friend told me to
do this and I guess it really helps.

A "variartion" of this mod was printed in Monitoring times (I think).
This version does not involve opening the radio and thus is less
risky. It involves shorting (using a wire) the audio jack and the
antenna. Becausae most earphones are made of plastic and have no
exposed metal I use the micro/mini metal adapter from radio Shack.
This restores the audio jack to full power. Of course perform this mod
at your own risk but it works with my 200XLT specially in noisy environments.

I forwarding the following eMAIL from NU8D

Tom, WB7ASR...

==========

I have one "mod" that one of my co-workers here at Xetron came up with. Put a (very small) 221k resistor (value not super critical) across capacitor C63 (which is a .47uf couping cap). You can put the resistor on the bottom of the lower pc board right across the capacitor pins that go through the board (the cap is a normal tubular radial lead electrolytic). This resistor will supply some bias to the audio switching FET (Q8) and prevent it from being biased partially off by the audio waveform. If you look at a sine wave before and after the mod, you will see one half of the waveform distorted (before).

A little harder mod is to rewire the volume control by reversing the wiper and hot lead. Right now, the .47uf couping cap sees a varying impedance (down to 0 ohms) because it is feeding the wiper of the pot. This means that all the lows will be rolled off at low volumes, but will be normal at maximum volume. This is the reverse of what a loudness control does. Reversing the volume control leads will maintain low frequency response at any volume.

Some additional info: The schematic shows the CORRECT wiring of the volume control. For both of our RZ-1's, the wiper and hot lead were reversed, causing the low frequency loss at lower volumes. This may have been corrected some time during production. There is a small connector that you can move the pins on to correct the volume control miswiring. To get to it you must remove the front panel. This must be done very carefully since there are 3 springs behind the vfo, scan and msg buttons that may fall out and get lost. Once you get it apart, the pins can be carefully removed from the connector and re-inserted in the proper locations.

Me too. I was pulled over late one night and while fishing for
my registration, he spotted the disassembled scanner in the
glovebox. He asked if his freqs were programmed. I told him
I didn't know (the truth) and that I had Philadelphia's
still programmed from earlier in the evening. He assembled
it, turned it on, and transmitted from his walkie on his
belt. I warned him that there may be duplication in frequency
assignments between Philly and there, but luckily there wasn't.

All of this shouldn't have happened though, since I later learned
that NJ's law had been repealed by the time of this incident.

I now keep the reg in my wallet ;)

Is there way to program groups of freqs on the 2006 so that you tell the unit to scanner one group of freq at a time.

Example: I have programed in the freq for cordless phones and Police freq, but I only what to hear the police freqs not the cordless. After listining to the police for 1 hour I want to switch to the cordless freq.

I don't know if the 2006 will do this without a computer interface kit. The manual that comes with the 2006 is less than helpful on the subject.

The only way to selectively scan by group in a standard Pro-2006 is by enabling or disabling a bank of 40 memories. There has been more than a couple of comments about the banks being too big.

I would be interested in any comments about the OPTO board and software that would make this situation better.

>If it's worth the $23 they want, maybe my wife will let me get one...

It will work, but it can cause overload. Unless you live out in the country, and are dealing with mostly weak signals, it will not help, and will most likely make things worse. Most scanners have very poor dynamic range.

Lets say you are listening to 155.625, and on 153.030 there is a strong transmitter like a pager, your scanner will reduce its sensitivity accross a band of frequencies making the 155.625 signal weaker, because there is one very strong signal present. An amplifier will only cause your scanner to become LESS sensitive. In such a situation, an attenuator would be a better solution.

This might seem obvious but have you tried putting the freqs in different banks i.e. Police in bank 1, Fire in bank 2, Cordless in bank 3 and then locking out the banks you don't want to scan? Maybe I misread your question, but that is how I set up my scanners.

It is my understanding that you can create banks of any
length. I've also heard that you can create a virtual
scanner of any number of channels.

I believe it directly drives the receiver instead of dumping
the desired freqs/modes into any channels. Of course the board
has to be pretty quick to change channels (and potentially
modes) as quickly as hyperscan does.

I would think the board would sort the search in ascending order of
frequency first and by mode second, since scanners can
change to a close and same mode frequency faster than a far away or
one or one of a different mode.

> ** Via the Aardvark Burrow BBS - 1-716-383-1372**

The length of a half-wave dipole is 468 divided by the frequency in MHz. This gives you a length in feet, so 468/100MHz = 4.68 feet. You feed it at the center, so you need 2 lengths of wire 2.34 feet long.

Check out the Radio Amateurs Handbook at the library or drop in on rec.radio.amateur.homebrew.

Berton,

if you stop and think a minute you will realized that there are probably
thousands of freqs active in these areas.

For a good list of freqs in Southern California you might want to get a
copy of Police Call, Southern California Detail Edition, which is about
$10.00 at lots of radio stores. You'll probably find enough in there to
keep you busy for a long time.

193. Fixed my Bearcat BC140 scanner, shorted electrolytic

Newsgroup: rec.radio.scanner
Date: 1994-08-04 23:05:10 UTC
From: wa2ise@netcom.com
Message-ID: <wa2iseCu19Go.DyF@netcom.com>
Source record: 270848

Got around to digging into my dead Bearcat BC140 scanner. All I had
was a DVM meter and a solder Iron. No diagram.
Initial problem: no reception, loud buzz. Check power supply, okay.
After a while, scanner starts being able to recieve signals, but
no squelch. Semi-random poking around with DVM, inconclusive.
Eventually figure out some of the circuit. uProcessor comes back
to life, can now program frequencies. (was trying to recieve DC,
ie 0.0 MHz). Then noticed that the scan function would hold a
frequency while a signal was present, but would resume scanning
when the signal went away. But audio would play loud hiss.
This told me that the signal strength detection was working, and
was telling the processor signal/no signal (squelch knob could vary
the threshold of this). Also tells me that the audio mute was
not working. Hunted and found the mute transistor (shorts audio to
ground when squelch goes on, or should). Found an electrolytic cap
electrically near the transistor and B+ had shorted out, and blew
out the base-emitter junction of the mute transistor. Replaced
both (scrounged off a junk PCB) and the squelch now mutes the audio.
Problem fixed. Noticed a voltage regulator gets a bit hot, but
still within limits, but heat sinked it anyway.

So, it's still possible to fix stuff sometimes. But if one of the
chips had blown, forget it....

^^^^^^^^^^^^^^^^^^^

Huh? If you don't want to scan all of the channels in a bank, lock them out. Thus making the bank smaller...

> I would be interested in any comments about the OPTO board and software
> that would make this situation better.

For an extra $350 odd dollars, it should make it easier. But remember, this will bring the total cost of your radio to $700+ Maybe you should have bought something better to start with?

If I want to use my scanner, I do not want to use my computer (Which by the way is *not* at home - So that means I have to buy a computer too, make that $1700+ for a scanner) Forget it... They also do not have a Mac interface for the OPTO board (yet). I will wait till that becomes available before I even consider it..

I like my 2006 just the way it is, well a strength meter would be nice, but that is on it's way..

I just recently bought a second hand pro-31.
It unfortunately came without a manual. I have a few questions which somebody hopefully can answer.
a) How long is the delay when delay button pressed and does it work in scan mode e ?.
b) How do I know when battery power is low ?.
c) Can I use any ordinary current limited power supply to recharge nicads ?. (Sales rep here said has internal charge cct for nicads is this true ?.)
d) Anyone in Oz got the manual that they could copy for me ?.
Thanks any answers appreciated.

On July 22, 1994, the Fort Lauderdale police dept. arrested Jay Harris, whose real name is Francis James Harris, at 3:52 AM and charged him with prowling. He was caught digging through a garbage dumpster outside a Motorola facility.

Harris has for several years published a frequency directory book, which was even written about in the past in Monitoring Times. Harris also operated under the business name of "Frequency Intelligence Administration" in the Fort Lauderdale Florida area..

At the time of his arrest, Harris had with him a Motorola 800 Mhz radio that was programed for many systems including those of area law enforcement agencies. Police say the radio was fully able to transmit on police frequencies and took the radio into custody. Motorola is also concerned about how he got the trunked system information programed into the radio.

For those of you who like or demand full details, the police arrest case number is 94-115333, and Harrs date of birth is 11/10/68 and his SSN is 509-20-2672. His booking number at the Broward county Jail is 94-7343. He gave his home address as 5861 NW 46 Terrace in Fort Lauderdale.

All of the above information comes from public records, and I make no claims to its correctness.

One more thing about MVT-7100. I dropped mine about 5 times since I owned
one (accidentally). 2 times it dropped on the stone floor of a local store.
(what a lousy owner!). And it still working as perfectly as in the first day
I've got it.
Any similar comparison to AR-8000?

Scary. I like to listen to mall security and they have a mobile unit
that drives around. I used to have the scanner resting on the rim of
my steering wheel, with the rubber ducky easily visible. Once, the
mobile unit parked right next to me and I thought for sure he'd spotted
the scanner. Now I keep it down by the passenger footwell. At any
rate, if I see them getting a bit too close I'm always prepared to
switch off their bank and put something innocuous on, like the 2-meter
Ham band or aircraft/weather bands.

It's so damn silly the way some people get bent out of shape over
scanners. I know a few cops and one of them in particular really
hates them.

-Dave

I won't allow myself to be drawn into a debate about the alleged superiority
of Coors vs. Budweiser, but I *will* say that such a discussion would be a lot
like arguing the relative merits of gonorrhea and syphilis. -Geoff Miller

For some reason I thought that it was legal to take or go through someones garbage once it was thrown away? Also I don't think Jay Harris would appreciate it that someone has sent his social security number over the Internet for all to see. Public record or not!

Randy

202. Icom R7100 WEFAX modification

Newsgroup: rec.radio.scanner

I want to receive wefax transmitions from geo- syncsink and low orbit
satellites.
The problem is that the R7100 has a wide band-pass of 250kHz and I require
a 30-40 kHz band pass. So the mod I am looking for will do just that,
replace (if possible) the very wide with a not so wide 40kHz. filter.

It is legal to search through somebody's garbage once it is not on
private property unless, of course, you wear a badge and possess a
search warrant. However, taking something from the container is
another matter altogether.

Jim Wayda (jim@ttech.com) wrote:
: I want to express my appreciation of the postings pertaining to
: modification of currently available scanners. On the other side of the
: coin, I am concerned about the posting modifications to CURRENTLY available
: scanners on rec.radio.scanner.

: This will call undue attention to the radio
: by the FCC or any other legal agency that could be reading
: rec.radio.scanner, and is equivalent to posting a front page article on in
: the LA Times.
You give them too much credit...

There are already numerous publications that include much more *graphic*
data on the cellular mods than appear here. The FCC is fully aware of
the situtation.

: This will result in the elimination of the radio, or
: production of the crippled "A" model. In the case of current model scanners
: that have hidden test modes or possible mods, I suggest the following
: method of providing this information:

Trust me, the FCC does not need to rely upon rec.radio.scanner to decide
what radios are next on the hit list. We can thank the wonderful lobbyists
for special interest groups who have a lot more money than we can
collectively field, to study restorable circuits...

: 1. Post you request regarding modifications to rec.radio.scanner.

: 2. Ask for modifications (do not specifically ask for illegal
: modifications)

>>>>> MISINFORMATION ALERT <<<<<

At this point modifications are *not* illegal. Importing, & commercial
selling of cellular capable "scanners" (remember 4 channels a scanner
make...) are. But, you're free to modify to your hearts content.

Understand that _listening_ is a statutory violation. But really, aren't
you just checking the quality of your own cell phone signal to be sure
that the emissions are within the prescribed limitations as set forth by
the FCC? I know that is only reason that I *ever* dial up the cell band. :)

: 3. All replies regarding scanner modifications should be via E-Mail only.

Sure, anon servers also...

: There is an abundance of excellent information available on this newsgroup,

Yes there is and let's keep it coming!!!

: and we must all make an effort to ensure proper disemination of that
: information. Some scanners manfacturers have given us excellent options,
: and we do not want to loose them.

Face it. You've lost them! Any [easily] restorable unit is already taboo
(after April 1994). Stock on hand can be sold but that's it.
Well, you can still bring a unit back into the country yourself...

Now really, don't you just suppose that keeping a secret about xyz scanner
being restorable is counter productive... You've obviously been living in the
shadow of Groom Lake for way too long. Secrets can't be kept.

On the other hand. Unless you do something really stupid, no one's going
to know if you're listening to phones or not. You can hardly get a timely
response from an FCC field engineer for harmful interferrence, even when you
track down the culprit and give them the info. They just don't have the
budget anymore for frequency police. That's one of the reasons that the
ECPA is such a farce. They're going to rely upon words on paper with
virtually no enforcement to keep us off a specific block of frequencies!
Unless you're a ham who decides to use a sheriff frequency to call for
aid to an injured cyclist... Then they're going to throw the book at
you... go figure!

Sorry, it's not going to work. But neither will it go away. Bad laws tend
to stick around for a long time. Especially when they're aimed at a group of
hobbyists who are not likely to form a group and fight as a class. Most
of us still spin the dial wherever we want to. Do you really think they 're
going yell "FCC" and kick in your door, antennas drawn, and place you in the
Federal Frequency Delinquency Facility?

So go ahead and publish whatever you like. We *STILL* have that right!

: My $.02
plus change...

: Can you not call Tandy National Parts and order it with a credit card?
: I live in the US and would do that before I ordered it through the store.
: Tandy National Parts is in Ft. WOrth Texas. I don't have a phone number.

This is assuming that Tandy (US) will handle export of the parts (unfortunately not as simple as putting in a box and shipping).

Perhaps you simply need to ask the French service depot for Radio Shack equipment for "Le schematics", as they may be able to help... One other suggestion is take a trip to the UK and you *should* be able to get what you need there. Depending where you are located in France, that may be an option. In the UK they are the Tandy stores.

I just got a the Bearcat 200xlt scanner... problem is I don't have a manual for it. I'm kinda on the clueless side of scanner use too. Does anyone know the number for Uniden's scanner dept (if they give/sell manuals)... or could someone be most gracious and photocopy (or scan, fax, teleport, etc) a manual for the 200xlt for me? It would make me a most truely happie person.

thanks
jason

: : the cable industry NOT lobby to have the FCC approval pulled on those
: : "kits" too!?!?!?

: Probably because they found it more profitable to simply sue the people who
: used the kits for Theft of Service - and collecting double or triple damages.

Yes, but they would be as likely as to be found -using- the device as
a person would be caught -listening- to cellular telephone calls. I
believe to do this, they would need to come in breaking down the door
yelling "Raid!" while the device was switched on and in use. Just
suspecting, or looking at it when its not turned on, even though it
may be present, would not hold up in court -- as use would not be
provable -- and I can see it now -- a judge signing a search warrant
because they believe a converter may be in use... HA HA...

When I get mine (which I may one day do), I will have it come to my
company address, such that they would not even have the benefit of
an address from the company records to help them!

Does anyone have and mods / undocumented features for the PRO-41 scanner?
I checked a few FTP sites and didn't find anything. Found it for 40% off,
guess RS is giving them the boot. Thanks for any help.

Paul Gunn (pgunn@alkali.otago.ac.nz) wrote:
: The Police in my area apparently use Motorola Sabre portables. Can anyone
: give me anymore details on them ?

Paul,
Motorola makes many types of Saber handheld radio. They can be ordered in a variety of configurations, too. Generally, they cover the VHF-HI band (135-174MHz), UHF band (406-512MHz), 800MHz band - Saber SI model (which can be conventional or trunked), and I've seen them in the 72-75MHz range. There are basically 3 models: Saber I, which is 12 channel and very few bells and whistles, Saber II, which is up to 72 channels, lcd alpha-numeric display and keypad control, and the Saber III, which is the top-of-the-line model with up to 120 channels, scanning, lcd display, keypad control, and much more.
All are IBM-PC programmable with proper software and interface, which can be obtained from Motorola. The Saber SI, however, must be programed by Motorola, because special authorization is required to operate on 800MHz trunked channels.

>
>I just recently bought a second hand pro-31.
>It unfortunately came without a manual. I have a few questions which somebody hopefully
> can answer.
>a) How long is the delay when delay button pressed and does it work in scan mode e ?.
When you 'delay' a channel, the decimal point after the channel number shows, and
the scanner will wait aprox 2 seconds before resuming scanning. To UNdelay a channel,
push DELAY again. Individual channels may be delayed. You must push DELAY while the
scanner is stopped on a channel, or in Manual mode.

>b) How do I know when battery power is low ?.
Three decimal points in the KHz range of the frequency display (123.4.5.6.) indicate
low battery.

>c) Can I use any ordinary current limited power supply to recharge nicads ?.
(Sales rep here said has internal charge cct for nicads is this true ?.)
Yes. I use the AC Adaptor to recharge the nicads. Just plug it into the 'CHG' jack.
I don't recommend doing this when using a 12vdc 'car adaptor', once when I turned the
ignition off and left the scanner plugged in, it sent voltage to adaptor, and it got
a little warm..no harm came of it though.

>d) Anyone in Oz got the manual that they could copy for me ?.
aye!

From: schroederk@rcwusr.bp.com
Message-ID: <1994Aug5.081128.947@rcwusr>
Source record: 270797

I'm wondering if the newest of the Radio shack Pro-43's is still modifiable? I looked at one last night, and D-4 is not present. If this is the case, how can you tell from looking at the outside if the radio is modifiable? I know the new ones have "Radio Shack" on the front of them, and I think the older ones had "Realistic" on the front. Is this a reliable way to tell the difference? Are all of the formerly restorable radios labeled in the same way? Thanks for the advice....

Find an inexpensive VHF only (or VHF-UHF w/UHF removed) Television antenna
of the type Radio Shack sells.

Add preportionally larger elements on the back end.

I haven't tried it myself, but it would be a fun experiment if
you want to cut and try.

Theory:

Channel 2 is 50 Mhz. ... longer elements will extend the frequency range
downward.

Perhaps someone else can add to this.

i.e. Estimate frequency of 1...2...etc additional elements?

From: georgem1@aol.com
Message-ID: <31tt6a$aul@search01.news.aol.com>
Source record: 270779

On June 21, I called up Marymac to order a RS Pro 43 scanner. I specifically told the salesperson that I wanted a cellular modifiable Pro 43. The salesperson said "Yes, it is cellular modifiable." So, I ordered one. A week later, the scanner arrived; I opened it up and looked for diode D4. It wasn't there! I called up Marymac and told them what the problem was. The guy says that Marymac would never tell anyone that their scanners were modifiable. I was shocked. He went on to say that if I send it back, then there would be a 20% restocking fee, too!

Needless to say I was pissed. Now I'm stuck with a Pro 43 that can't scan cellular. I might as well have purchased a cheaper scanner like the Pro 39 or the new 51.

Those are the facts. So, BEWARE OF MARYMAC.

George :-(

No one seems to understand your question. The answer is "no" if you only have one scanner. (Shame on you!) But, not to worry! Here is what you *can* do. You *can* enable the memory banks you wish to scan at a later time, then set a timer on the power cord to the scanner, and then set the scanner to MANUAL on ONE frequency. In this way, you can log traffic on ONE channel unattended and switch to the SCAN mode at a certain time, because the scanner "wakes up" in scan mode.

Has anyone anywhere started a pirate radio cell station? Here's my idea. First, you have to have some money and no life. Then, use an hour of air-time every night to broadcast your own show over the airwaves. Of course it's really anti-pirate, because it's legal to broadcast (you paid for the phone and air time) but illegal to listen! You could do QSLs and everything! No DX though... Has anyone ever done this? Just curious...

This does sound like a lot of fun.

Just remember to do this using **someone else's** cordless phone.

If you do this from your own phone, you are going to be getting a LOT of parking tickets for a while. The cops will be watching you like a hawk, just waiting for you to screw up. Either because they think you are really a drug dealer, murder, child molester, etc. or because they know that you got a big laugh out of screwing them.

236. Shuttle Frequencies, So. California

Newsgroup: rec.radio.scanner
Date: 1994-08-05 21:20:43 UTC
From: jim@ttech.com
Message-ID: <jim-050894132043@jimsmac.ttech.com>

Could someone pleases post or E-Mail me the 2 meter and 440 amateur repeater frequencies that are used to rebroadcast space shuttle transmissions in the Southern California area. I am in the Anaheim area (specifically Yorba Linda)

thanks,

-Jim

237. Re: Frequencies

Newsgroup: rec.radio.scanner

Cross-posted to: rec.radio.scanner,alt.radio.scanner

Looking for a used ICOM R1, must be in excellent condition, with owners manual, and original documentation, and the owner must be desperate to sell ;-)

Whats the best price anyone has seen one new for?

Thanks

jeffb@ne.logica.com

241. Nellis AFB/Area 51/and1/1

Newsgroup: rec.radio.scanner
Date: 1994-08-05 22:09:00 UTC
From: roger.cravens@pics.com
Message-ID: <5393.449.uupcb@pics.com>
Source record: 270801

And for those summer vacationers to the wonderful city of Nowhere, NV, here are a 'few' frequencies for the most controversial Air Force base probably in the world.....if anyone has any more, please advise:

==========

I have put these together for Nellis AFB, NV (Dreamland, Area 51, etc.) with a minor emphasis on Holloman AFB because there appears to be an operational connection between the two Air Forces bases. What this connection is remains to be seen to use here on the east coast (Atlanta, which is where this list originates).

Below this you will find more general and associated Government frequencies that might be worth your time scanning various ranges. The only thing I have left out are frequencies for rail operations in and out of Nellis and Holliman since I could not find that information anywhere. That's not to say it's not available, I simply didn't take the time to make a trip to the local FCC office an dig them out. They, too, would be interesting to monitor in terms of what heavy cargo is coming in and out of these Air Force bases. Most, if not all, brances of the Armed Forces have their own engines as well as individual pieces from flatbeds to whatever size need to haul their cargo.

The following military units and organizations have been identified as having a home-base at Holloman AFB:

46th Test Group (AFMC)
475th Weapons Evaluation Group
49th Fighter Wing
4th Space Warning Squadron (AFSPACECOM)
83rd Air Control Squadron
ACC Base
AT-38B Operations
F-117 Operations
F-4E Aircrew Training
German & Taiwanese Aircrew Training
MH-60 Helicopter Operations (Search & Rescue)
Phillips Laboratory Balloon Branch

The following military units and organizations have been identified as having a home-base at Nellis:

26/64/65/527/5021 Tactical Operations (Agressor) Squadrons
414 Composite Training Squadron (Red Flag)
4440 Fighter Training Group
4450th Tactical Group
4477th TES Red Eagles

549th Joint Training Squadron (Air Warrior)
552d Tactical Operations Force
554th Combat Support Squadron
554th Medical Group
554th Operations Support Wing
554th Support Group
57th Fighter Weapons Wing
57th Logistics Group
57th Operations Group
57th Test Group
66th Air Rescue Squadron
820th Civil Engineering Squadron (Red Horse)
896th Aviation Depot Squadron
99th Tactics & Training Wing
ACC Base
Air Force Air Combat Command
F-16 Agressor Operations
Fighter Weapons Center
Fighter Weapons School
USAF Special Weapons & Tactics Center
USAF Special and Conventional Weapons School
USAF Thunderbirds Team

==========

Here are some random frequencies that are pretty general across the US
and you might want to scan frequency ranges or specific frequencies
given here depending on just what you are searching for. Because the
Department of Energy is intimately involved in activities surrounding
Nellis AFB/Area 51/Groom Lake, it is reasonable to assume that any
frequency is fair game:

Like I said, it allows operation only on Business Only frequencies
in these bands. Nowhere in my post did I say I could use it on other
service's frequencies.
Though it does LEGALLY authorize operation on frequencies such as
27.430, 27.450 and others in the band you referred

The problem is that the guy lied to him just to sell a scanner. Marymac did the exact same thing to me. They guys name was Joe. He told me when I ordered it that it was 100% modifiable. Then when, I read on the net a week or so later that non-restorable ones were hitting the market, I called them back and Joe said "If you're not satisfied just return the product." As soon as I hung up the phone I rushed to the nearest Radio Shack and bought a modifiable one on my credit card. Then next day the Marymac one came in (Non-restorable of course) which I quickly returned to Radio Shack. Everything worked out fine for me but I'll never buy from them again and I tell everyone I know not to either. What a bunch of slimey little weasels. I now believe in buying locally even if it costs a little more.

Mike

: In article 9mv@ncar.ucar.edu, jksmith@platypus.atd.ucar.edu (Jeff Smith) writes:

: I remember a friend who had one of those HBO antennas on his house in the
: pre-scrambling days. The local provider (cable co or HBO offic I don't know)
: went on a rampage and sent trucks scouting these offending sites (residential
: neighbourhoods) and issued a letter stating that a decision be made, pay-up or
: get sued, and the offending antenna must come down. This cost him several
: hundred dollars but kept him out of court. Apparently lawyers and courts don't
: think that just because you can receive a signal you deserve too. Also, Another
: guy on the same street had his antenna in his attic. No lawyers or letters. So
: I guess its only illegal if you get caught :>)

I was one of the folks who purchased an over the counter receiver for HBO
because my community (Palo Alto) couldn't figure out how to slice up the
money from the cable companies. Consequently PA was one of the last on
the peninsula to get cable service.

When HBO decided to try and bully me, I refused to budge. They kept
sending me threats about court action but decided it probably wasn't in
their best interest to follow thru with it. I know that most everyone
else in the community paid the $300.00 requested by HBO and took
their antenna down. Although I no longer live there, the antenna remains
today. No nasty letters from Showtime or HBO were ever received again...

Eventually, I installed a satellite dish but refused to by a pirate
descrambler. I opted to be legal and pay for the services that I wanted
to see.

If I were a cell phone user and wanted privacy I wouldn't expect it to
come from the restriction of your right to listen. I'd encrypt my cell
phone. The responsibility should remain with the user of a service, not
the rest of the public. In addition to letting the public listen, I'd also
extend the privilige to any law enforcement agency. If you're silly
enough to discuss criminal activity openly over the air then Darwinism
dictates you should learn from your stupidity...

Whether you like it or not, if it should be legal for all of us to monitor
a frequency then it should be legal for *THEM* to listen in also. Users
of cell phones and cordless phones should be educated that they have no
implied right of privacy unless they choose to encrypt. If, however, the
signal is encrypted I would have no objection for it to be a crime to
decode it without prior authorization.

>Has anyone anywhere started a pirate radio cell station? Here's my idea.
[...]
>You could do QSLs and everything!

Whenever I talk on my cellphone, I'm acutely aware that there's an audience out there. Often I'll say wild and outrageous things just because of that. I hadn't thought about QSL cards - that would be cute if you had a P.O.Box and didn't have to give out your address.

But what about real pirate stations? The latest issue of _Monitoring Times_ lists quite a few stations, a lot of which seem to be in the lower part of the commercial AM band (e.g. 743 kHz). Has anyone ever heard one or gotten a QSL card from one?

-Dave

I won't allow myself to be drawn into a debate about the alleged superiority of Coors vs. Budweiser, but I *will* say that such a discussion would be a lot like arguing the relative merits of gonorrhea and syphilis. -Geoff Miller

From: bsaladino@aol.com
Message-ID: <31uqdu$mm8@search01.news.aol.com>
Source record: 270796

All,

I live near Fort Worth, TX where the old Carswell AFB has been closed and reassigned to AF reserve units, and now Marine units. The new name is Naval Air Station Fort Worth, Joint Reserve Base.

According to the Fort Worth Star-Telegram Page 16 8/2/94 the Marine Aerial Transport Refueler Squadron number 234 from Glenview, IL and the Marine Air Traffic Control Squadron number 28 from Memphis, TN have already been relocated here.

Does anyone have any frequency information on these units that might carry over to the new base? I guess the local refueling tracks will still apply, unless AF and Marines use different tracks and frequencies. Any ideas?

Can anyone offer any insight into the ATC squads mission?

Thanks,
Ben Saladino KC5IRJ
Hurst, TX

Here are a few - You might want to drop the $10 for a Police Call at Radio
Shark - it lists a lot more than I will here.

For Rocky Mountain Nat'l Park I know two:
166.350 168.350

You'll be in or near Roosevelt Nat'l Forrest:
169.175 and 169.875

You'll probably also be in or near Estes Park:
Police - 155.910 159.135

Larimer County Sheriff:
154.710 155.130 154.295 155.565

Larimer County Search & Rescue
155.205 055.265

Hope you enjoy your trip!

What is this illegal 800mhz stuff? The Radio shacks around here are selling Pro-51 scanners, which are 800mhz modifiable by the keypad, and they say they aren't discontinuing them. Wal-Mart had 6 or 7 scanners that claimed 800mhz capability.

What is this?

268. Mods for for Pro 41

Can someone email with the mods for a Radio Shack Pro 41 scanner, that is if there is a mod possible. The scanner was purchased in Canada if this is of any assistance.

Thanx in advance...

PS you can email me a geoff.steuernol@deepcove.com :)

That's bizarre. 82.5 is damn near centered on the video carrier of TV channel 6, and 88.5 and 100.0 are of course in the FM broadcast band -- the latter isn't even a valid FM channel. I can't imagine the FCC authorizing anything but a "Mr. Microphone"-like Part 15 gadget in the FM band, and I don't think there's any equivalent to such gadgets for the TV band.

Are you sure about those three, Patrick? Where did those numbers, specifically, come from? Maybe whoever heard these was really listening to images?

NEVER believe anything that they tell you at Radio Shack or Wal-Mart! The
Congressional Ban doesn't specifically include 800Mhz. It simply states
that radio's capable of recieving Cellular Phone Conversations cannot be
manufactured or imported. So, any store that has these in their
inventory can sell them but once their gone, their gone.

I'm currently in the market for a base scanner. I'm leaning toward the 2006 after reading all the good things about it. Are there any other scanners I should consider with similar performance and price (perferably cellular modifiable)?

How about the Bearcat 85000XLT-J? I've seen it discounted to put it in the 2006 price range.

Whats the word on the 2036? I like the rotary knob, but the RS salespeople were no help at all when it came to comparing it to the 2006.

Thanks for any help.

278. Freq. Counters: Optoelect. vs. Startek.. Opinions?

Newsgroup: rec.radio.scanner
Date: 1994-08-06 19:48:44 UTC
From: mjr@crl.com
Message-ID: <320pes$3oj@crl3.crl.com>
Source record: 270727

I am considering the purchase of a medium to high end frequency counter. Primary mission will be to quickly identify tactical frequencies in use on site with various incident drills. It must be small, operate quickly, and be easily readable in bright sunlight as well as low light conditions.

The Optoelectronic and Startek series seem to be the ones most often advertised. Startek come in about 20% less expensive then Optoelectronic for similar features. Most of them are smaller in size as well.

Does anyone have any opinions about these two competitors? Are there yet better and more cost effective counters to be found anywhere?

Thanks much

Does that mean I should purchase a Radio Shack Pro-51 which is on sale
for $200, that can scan 806-823 851-868 896-956Mhz frequency ranges?
Once they are out of these are they not going to manufacture them again?
I'm also confused.

OK, enough already.
There is no 800mhz ban.
Scanners capable of receiving the Cellular portion of the 800mhz band are
the only one affected. Basicaly, the new scanners cannot be capable of
receiving, or be easily modified to receive the cellular portion of the
band. They (dealers) are still allowed to sell all of the Cellular capable, or
easily modifiable scanners that they have in stock. When those are gone, thats
it.

This is something I'm still trying to come to grips with, myself. If the decryption requires obtaining stolen equipment, I agree 100%. If it requires bootleg equipment (e.g., manufactured in violation of someone's patent) sold for profit, I can still agree. But if a listener can come up with a homebrewed device, I'm no longer so sure. If the principle is, "If it passes through me, it's mine to do with as I please" I would prefer it not be a crime to decrypt if it can be accomplished without purloined materials.

(1) I would prefer that such notices be sent as replies rather than followups. Can't say why for sure as I have no objection to those with no financial interest recommending vendors. Just one person's opinion. I post this to the net rather than reply privately to the poster because I have seen many such postings of late and am curious as to others' reactions.

(2) People interested in modifiable scanners should be sure to check on what step sizes are available when the scanner is modified for extended RX. Many have been disappointed to find only 12.5kHz available when 30kHz was preferred.

> up on that end.

I would consider doing it even at this late date. In order to give
them the benefit of the doubt, I'm trying to think of a way Marymac could have
misunderstood the question. I am not being successful.

288. Disconne ant. worth it?

This sounds like a rather painful way to do it. TACS uses 8 kbit/sec PSK for the control channel, which is much easier to decode in hardware than software (in fact it's not hard at all to do in hardware). The real challenge isn't TACS but GSM, which basically can't be done unless you have a lot of money, time, or both (GSM uses burst transmissions, TDM, frequency-hopping controlled by the control channel, convolutional coding for error control, the ability to stuff control information into the traffic channel, and so on and so on, all of which make monitoring quite tricky even before the speech compression and encryption are taken into account).

Peter.

How true, most all the Uniden products have that incorrect spacing after
cellular mods, which makes this add even more disturbing.

I keep hearing that the BC855XLT can be modified to restore the cellular frequencies. But as yet have not found how to go about it.

Any Ideas?

GW

Remember that the mere possession of RF amplifier capable of being used with
a CB is considered de facto evidence of use, unless you hold the appropriate
amateur radio license. Be careful here and don't laugh too soon!

295. "WOODSTOCK '94" FREQS?

Newsgroup: rec.radio.scanner
Date: 1994-08-07 09:18:08 UTC
From: dra@pipeline.com
Message-ID: <3228sg$hrm@pipe1.pipeline.com>
Source record: 270756

I'll be at "Woodstock '94" in Saugerties, NY starting Tuesday (8/9). Anybody have any info on freqs being used by the promoters/on-site security etc?
I can report that no wireless mics will be used on the stages. I will hopefully be able to report...after the fact...on the myriad of activity I monitor there; I'll be equipped with a frequency counter and several scanners...unfortunately, search time will be limited.

The 2006 is/was the 400 channel triple conversion base/mobile scanner (the
portable PRO-43 is also triple-conv).

Yep, Rat Shack is coming out with a 1000 triple conversion scanner soon.

Not really. The previous poster mentioned that there is no CRIMINAL liability, but that the remedy would be CIVIL. Therefore, the person whose conversations were illegally intercepted by the scanner operator could sue the scanner operator in tort. IOW, it's still not okay legally, it just does not violate 4th Amendment protections.
In my Criminal Law class, we learned that as long as govt officials did not solicit or corroborate with the person who illegally obtained incriminating evidence against a third party then the evidence is admissible. Question: what if the govt agreed not to prosecute a thief who obtained evidence against a drug dealer by burglarizing the drug dealer's house in exchange for the thief's testimony, etc?

BTW, legal =! moral 100% of the time. It's legal to pass by a dying person on the street without offering help. That does not make it moral.

Mark Saran (msaran@olympus.net) wrote:
: Used today in Seattle and last year at Abottsford B.C.

: 245.75 am

From my understanding, the mil-air band has 0.1 MHz spacing. I think that this should actually be 245.700 am, which happens to be the Snowbirds' channel 11.

Or maybe Canadians do it differently.

I have my PRO-33 handheld scanner for sale. It is in excellent condition. Has 20 channels. good sensitivity and excellent audio. Receives 30-54, 136-174, 380-512 mhz. Uses conventional or rechargable batteries. I just bought a PRO-51, so this one is surplus. Asking $75.

David Alpert said:

DA>I'll be at "Woodstock '94" in Saugerties, NY starting Tuesday
DA>(8/9). Anybody have any info on freqs being used by the
DA>promoters/on-site security etc?...

David,

Ummm.... When Leary said "Tune in, Turn on, Drop out," I don't
think this is exactly what he had in mind! <g>

Have a good time.

I saw a good Woodstock tagline the other day:

"I don't remember anything about Woodstock,
so I must have been there!"

Enjoy!

Tom

> >
> >Oh...so if it's okay legally, it's okay morally.

David Leon wrote:

> BTW, legal =! moral 100% of the time. It's legal to pass by
> a dying person on the street without offering help. That does
> not make it moral.

Well...I should have been more explicit. My post was ironical.
I meant to register a strong, sarcastic objection to the thrust
of so many of the postings in this thread and related threads--
postings which put forth the view that since one can legally get
away with turning in one's neighbors for smoking a joint or
calling out for a prostitute, etc., it's okay to do this. It isn't.

And the fact that the system supports doing this--even tacitly
encourages it--is no justification for doing it, either.

A lot of the postings condone--or even advocate--turning in
neighbors who are overheard talking of buying, selling or using
illegal drugs. The drug problem is not monolithic. In fact, it is
probably more accurately viewed as two problems: the public health
problem of addiction or abuse (not use) and the crime that
flourishes as a direct result of the government's wrongheaded
approach to the first problem. This is really the wrong place to
go into that any more deeply, but at least in the minds of a few
of us, there's a big difference in turning in someone who sells
addictive substances (heroin, tobacco, alcohol) to children and
someone who recreationally uses drugs of any type. And, to head
off possible bilious speculations on my motives or proclivities:
no, I don't use drugs other than some alcohol and some coffee.

The idea that one's privacy shell has been cracked by a neighbor
with a scanner is one thing. The idea that one's activities and
eccentricities must now pass muster with the eavesdropper--or he
may turn you in--is, frankly, sickening. And, I speak as a scanner
enthusiast--even though it may not sound like it here.

This is where, undoubtedly, someone will wish to pose the most
outrageous hypothetical counter example possible. Spare me. If I
heard something that I thought might result in SERIOUS HARM TO
OTHERS, I would turn them in. If I heard someone talking about
doing something I don't do, and don't think others should do,

I'd keep my mouth shut and lump it.

David S. Eitelbach
dseitel@crl.com

308. Certain Freqs Needed - Los Angeles Area

Newsgroup: rec.radio.scanner
Date: 1994-08-07 22:25:42 UTC
From: g9153402@huey.csun.edu
Message-ID: <323n16$n68@nic-nac.CSU.net>
Source record: 270770

I've just had a scanner for about a week. Sort of an impulse purchase. Saw it on sale so I bought one. I programmed many local police frequencies in it from 'Police Call' I bought at Radio Shack. I wanted the book 'Beyond Police Call' too, but the local Radio Shacks didn't stock it.
Anyway, I'm looking for some frequencies for the VA Medical Center Police (Sepulveda & West L.A.), Cal State Northridge Police (the ones listed in 'Police Call' just seem to be quiet), and any interesting commercial systems in the area.
Thanks

309. New R1 Restorible?

Does anyone know if the new ICOM R1 (I think it's called the R1A now) is cellular restorable?

310. Detect detector?

Newsgroup: rec.radio.scanner
Date: 1994-08-08 00:02:21 UTC
From: gesman@io.org
Message-ID: <323smd$i35@ionews.io.org>
Source record: 270774

Question to radio professionals:
How is it possible to detect a radar detector? As far as I know
radar detector is a receiver, which detect certain (10-20+ GHz) frequency
and gives alarm (to user). How is it possible to detect a detector and even
more - to detect it from, say 100 meters distance?
I'm not talking about jammers(which are transmitters), only about passive
detectors.
Anyone has ideas?

311. Delaware Info?

Newsgroup: rec.radio.scanner
Date: 1994-08-08 00:03:05 UTC
From: mtaylor@FRICKA.DUCH.UDEL.EDU
Message-ID: <323snp$q0a@louie.udel.edu>
Source record: 270773
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I just picked up a scanner after many years of thinking about it and never doing it... I'm glad I finally did. What a blast!

I also bought Radio Shack's "Police Call" for the area; it seems to be a BIG waste of 10 bucks - almost none of the freqs listed appear to be in use; I've actually found more good freqs by laborously scanning the WHOLE band-set repeatedly, but can't tell what public service HQ uses each one.

Would someone please post any/all of the following (or email to me):
* List of Interesting frequencies for New Castle County DE and surrounding areas (like Elkton) - preferably with who's who.
* Any Enthusiast groups in the area that I can hookup with.
* List of non-public-service freqs in the area (like hotels, sports, garages, whatever)

Thanks in advance... Mark T.

I believe that all superhet receivers have some emissions from their local
oscillator; enough to be detected possibly.

A few years back "Road and Track" did an article on this. They went to canada to test on out with the police. It picks up an oscolator(sp?) in the radar detector. these clock chips or oscelators are very noising at a certen freq, and can be picked up several thousands of feet away.

The "stealth" radar detectors use a much more expensive clock chip that emits much less noise (but still emits some noise).

As I understand it, if you are caught with a detector where they are against the law it can be taken away on the spot. The best defense to having a detector taken away is to pick up a cheap $10 one at walmart and keep it in the glove box. Give the cheap one to the officer when they pull you over so you don't have to give up you nice expensive one.

Tim

>Anyone has ideas?

The same way the British find unlicenced TV's.. All recievers do transmit
a signal,albeit weak from the local oscilator stage, this is the signal
that the VR-2 units (that's the one the local police up here use...and
they do work!) Even your scanner puts out a signal most are around 10.7 Mhz
some are different.. but if you have a shortwave radio try tuning down to
10700 Khz with the scanner turned on and close to the sw radio. You'll get
a point were you'll get the feedback of the scanner over the sw radio.
This usually is a beat , sort of thump, thump, thump... Allyou have to do
is tune the reciever very precisely to the radar detector oscilator stage
frequency with a sensitive enough reciever and bingo! Gotcha!!! Go directly
to jail do not collect $200.00. The radar detector-detector is very very
sensitive to a very narrow frequency band, and is very directional, but
then they don't need to know where all the radar detectors are just the
ones along the path of the speed trap.

Added feature on the Radar Detector-Detectors is a search mode that can
find the nearest donut shop (GRIN!) this is very complex technology, but
as you may notice works very well too. (Grin)

i have a problem with my RS 2004. i have to replace the 9 volt battery every two weeks; it seems to drain the battery very fast. when i sometimes turn the radio on, the display is blank until i insert another 9 v battery.

does anyone else have this problem?

GE>Question to radio professionals:
GE>How is it possible to detect a radar detector? As far as I know
GE>radar detector is a receiver, which detect certain (10-20+ GHz)
GE>frequency and gives alarm (to user). How is it possible to detect a
GE>detector and even more - to detect it from, say 100 meters distance?
GE>I'm not talking about jammers(which are transmitters), only about
GE>passive detectors.
GE>Anyone has ideas?

The swept local injection oscillator is used at the mixer stage. For some units that use feedhorn type circuits, this injection signal can be large.

If the unit is not completely RF tight, it can radiate like the devil. One auto magazine tested several brands and found some detectable up to half a mile away.

Every modern superhetrodyne radio receiver has a local oscillator that will radiate to some extent. These radar detectors are somewhat hot in that respect (size of the L/O signal).

Well, ok, why not.

Once a friend had a scanner going in his apartment when he locked
on to an apparent cordless phone conversation.

It was two adult females (sounded slightly intoxicated) talking at
appx. 1 am.
They were talking about their present boyfriends etc. Then the question
that raised eyebrows across the room, "do you ever let him stick it in
your tail"? Needless to say, the following conversation was carefully
listened to. :) By the way, the answer was something like: "Well, yea, I
did once, but I couldn't sit down for 2 days, and never again".
The group listening were all young males and partially drunk.
You can imagine the fun they had with it. :)

While scanning certain ranges with my pro-51, the signal I recieve gets overidden by the chatter of what sounds like a taxi cab service and a local police station. This is incredibly annoying, as the interfering signals totally take over the frequency I'm using. Is there any way to tune this stuff out? Also, how is it possible that these signals go out without messing up what was using the frequency in the first place? In addition, a taxi/police broadcast gets picked up over a wide range of frequencies (around 50 Mhz). What's going on?

> BTW, legal =! moral 100% of the time. It's legal to pass by
> a dying person on the street without offering help. That does
> not make it moral.

Actually that is incorrect. There are very few things in this
world that aren't illegal. So it IS illegal to pass someone up who
is in danger. I believe the test case was someone who didn't try and
save someone who was drowning(sorry I don't have specifics).
Why do we think it's our responsibility to enforce the "law" ?
There are already too many laws. And certainly issues like minor
drugs/prostitution while morally MAY be wrong, are certainly none of our
business(well legally anyways) and are a matter of choice.

So do most of the European countries, including Holland. Great Britain has
a national broadcasting corporation (the BBC) which is financed out of these
licence fees. The Dutch public broadcasting stations (we have quite a few)
are also partly financed out of the licence fees and partially from the
revenues of commercials.

Even if you use your TV just to watch commercial stations, you still need to
pay that licence fee, yuck!!

The radar detector that I use will ping occasionally when I'm coming alongside another car that has a radar detector in use. So I guess it's sensitive enough, almost, to be a detector, detector.
Also a neat trick is jamming another FM radio. At a previous job I had a gentleman sitting at the same bench I worked, about 6-8 ft. away. Needless to say, his choice of music to me was like getting a root canal without Novacain. I brought in a cheap, crappy portable radio and tuned in below the station he had on. It should be the IF freq. that you tune below. That just made his station fade out. He thought it was his radio that wouldnt tune in that station.
Again make sure it's a cheap radio. The cheaper the better, the shielding of the IF section isnt as good so it transmit's better.

Mine was when I caught my girlfriend(now EX for the following) making 'weekend' plans on my carphone while I was playing with my HT that I had just mod'ed and showing to my friends. Yes that's right, I was showing off my Kenwood Th-78a to some friends and I locked onto a cell freq that was really strong. Then I hear the voice and as I turned my head, the voice and the face of my girlfriend were in perfect sync. I didn't say anything or do anything until after the conversation was over with and she had made plans with a guy that she works with. Needless to say, when I repeated the conversation (Hotel, rm# and other nuggets of info) she turned a really neat shade of white and then red. Needles to say, I'm marrying her now ex-best friend!! HA! TRUE STORY!

I love my 78-a!

The BBC is non-commercial and government funded (ie public money funded) so a good way to collect this money is to 'licence' TV reception.

If you have a TV in your house which gets switched on - they can find out and fine you if it is not licenced.

Licences are 80-odd pounds a year and the fine is a thousand.

The Radio Shack multiband vertical (29.95) is a much better performer than their discone. The RS discone does not cover as low as 25Mhz. The vertical, which I use, has elements optimized for specific frequency ranges, including 30-50Mhz. I added 2 more vertical elements for the 250-400Mhz and 800Mhz bands.

Thank you. A moral conscienscious citizen should make best use of what they
intercept. The law enforcement agencies will more than happily accept
anonymous tips. Let's face it, if the police make a bust thanks to a tip
(and they keep it anonymous too, this is the REAL world, I assume they
won't reveal that it was an anonymous tip) they look good for preventing
a crime.

I agree. Public saftey is improved for all when fellons are
tagged by anonymous tips. Then it is the responsibility of the police to
act or not act on the tip. Only a morally screwed up person would
generate a fake or hatefull tip falsely IMHO.

Hi all.

Well, the saga continues and I am continuing to verify, first hand, all kinds of lore about antennas.

Latest tidbit for those interested -

There is a mobile scanner antenna (hole mount) sold by Antenna Specialists with the model number MONR1. Looks okay at first sight in the catalog - 3/8" hole mount, cuttable from 108 to 512 MHz, easy install.

I purchased one.

A more miserable piece of shoddy design and workmanship I have not encountered.

The whip is extremely thin (read not even slightly rigid) easily bent and likely to flex excessively at speeds above 10 MPH. The whip did, in fact, arrive badly kinked once it was take out of the plastic packaging that was keeping it straight. (^taken)

The base component of the antenna is made from a soft plastic that has threads that will strip easily.

The entire method of making the electrical connection between the coax and the whip looks as if it will be prone to intermittents in later years. I don't trust anything that uses a leaf spring to make a circuit to remain reliable.

Summary - I've installed a lot of antennas over the years on cars, this is possibly the worst quality and design I've seen.

Next - how the Larsen antenna stacks up!

This is common in busy metropolitan areas. You are probably hearing hetrodyning, or mixing frequencies. There are a number of ways this can happen.

Signals can mix in a transmitter amplifier. Usually caused by a higher than usual VSWR and a lack of transmitter isolation.

Signals can mix in the front end of your receiver. Scanners are so broadbanded that just about everything is getting to the mixer.

The people that are actually using these frequencies may see some of this interference but probably not like you do. Commercial radio equipment is generally much more selective than your scanner. This keeps unwanted signals at other frequencies from getting through the front end of the receiver.

The only way to reduce this would likely be to increase the selectivity of your scanner. Not a practical option if you still want a multiband receiver.

I'm confused... it's my understanding that ICOM R7000/7100's
with continuous coverage are no longer imported - but if they
happen to be here (in the us), they can be sold.

Questions:

- what is with the Grove circular in the mail recently
that implied that continous 7000's would be sold only
to approved agencies.

- are there in fact, any NEW R7000/7100's (continous)
actually available, for sale in the US?

thanks,

I am starting to look for a new scanner and would like to hear from
others that have suggestions on models and features I should be looking
for. I live outside of Charlottesville, Va and don't even know what all
I could listen to, so if you can give me any frequencys local to me that
would help too. I don't want to spend thousands on the thing, but I
would hate to go to Radio Shack and ask the guy behind the counter only
to find out later that I could have had a lot better unit if only I had
done my homework. Thanks for your opinions.

Well, is Opto going to make a new version of the 456 for this new 1000 channel scanner? I'd buy it just for being able to scan the cellular frequencies! That is something Opto has an advantage on -- they are not manufacturing scanners, but many electronic goodies for existing scanners.

I sure hope they make an add-on for this model too!

You can buy a spray on shielding material (nickel or silver) that you can use inside of the radar detector to reduce emissions. I think I saw this in one of
Bill Cheek's books.

Thanks for that posting. Nice job on a very broad topic.
Just two comments.
1. You may want to consider redoing your gain figures. It looks as though you have used an isotropic radiator for your gain figures (like for the discone, which has unity gain when compared to a 1/2 wave dipole as you suggest in your section on 1/2 wave antennas).

2. One thing many people fail to consider on Log Periodics like Create's, is that they are very much like using a broad band pre-amp. They will cause FM Broadcast, Pagers, etc, to come in stronger as well. So it can make image and intermod problems get worse, or futher contribute to front end overload.

Oh! I forgot to mention that the latest news on the AR8000 is that the
cellular range is removed (and therefor restored) via the computer control
interface. Word is that only dealers will have the software necessary to
delete (restore) the cellular range. EDCO has received FCC approval to
sell the AR8000 in the US and no hardware mods were apparently necessary.

Yes, Grove's catalog was a bit confusing. The R7000-2 and R7100-2 have
cellular deleted and can be sold in the US to anyone. The R7000 (now also
called the R7000-1) and the R7100 (R7100-1) can only be sold to government
agencies.

SECTION 9. FRAUDULENT ALTERATION OF COMMERCIAL MOBILE RADIO
INSTRUMENTS.
(a) Section 1029(a) of title 18 is amended by striking the word
"or" at the end of subparagraph (3) and adding the following new
subparagraphs:

"(6) knowingly and with intent to defraud uses, produces, traffics in, has
control or custody of, or possesses (i) a scanning receiver or (ii)
hardware or software used for altering or modifying telecommunications
instruments to obtain unauthorized access to telecommunications services."

Notice how this outlaws cellular capable scanners: now mere possession
is outlawed if this silly bill makes it into law. Of course with a "silly Bill"
in the white house, I wouldn't be surprised if it does get enacted.

Your freedom grabbing Democrats love this act.

"(7) the term 'scanning receiver' means any device or apparatus that can be
used to intercept a wire or electronic communication in violation of
chapter 119 of this title."

Cross-posted to: sci.crypt,rec.radio.amateur.digital.misc,rec.radio.scanner

lately i've become interested in the level of security actually provided by the 900 mhz spread spectrum phones. for instance, could a hacker with a pc and a smattering of outboard hardware have a good chance of decoding one's 900MHz phone calls?

does anyone have any details on the ss systems used in, say, the escort phones? spreading sequence generator, moduation methods, synchronization schemes, etc.? one of the felows that i talked with at cincinnatti microwave suggested that their phones choose a spreading sequence randomly whenever the phone gets used. is this true?

being a ham, i know that the fcc has allowed hams to use one of two linear feedback shift register schemes to generate the spreading sequence for direct sequence and frequency hopped systems. this makes it extremely easy to intercept a transmission. if the phones were this vulnerable then it would be difficult to make claims of security, eh?

also, since a lot of conversation time is "dead" time - mostly silence - does this provide the attacker a rather simple way to get the spreading code? i am assuming that the digitized voice level is mixed with the spreading code here - maybe someone who has more insight can comment on this method of attack.

if you've got the technical info, please pass it along. i'll post a summary.

The scanner stuff is buied towards the end, so I did not want to
post the entire text without first generating interest by highlighting the
scanner part. Please folks, let's get together on this and defeat this
blatant attack on your an my freedom!

Many thanks to Dave Emery for forwarding this to me.

DRAFT - August 1, 1994

SECTION 1. INTERCEPTING DIGITAL AND OTHER COMMUNICATIONS.
Title 18, United States Code, is amended by adding the following new chapter:
"CHAPTER 120 -- TELECOMMUNICATIONS CARRIER ASSISTANCE TO THE GOVERNMENT
"Sec. 2601. Assistance requirements.
"(a) CAPABILITY REQUIREMENTS. -- Except as provided in subsections (b),
(c) and (d) of this section and subsection (c) of section 2606, a
telecommunications carrier shall ensure that its services or facilities
that provide a customer or subscriber with the ability to originate,
terminate or direct communications have the capability to --
(i) expeditiously isolate and enable the government to intercept, to the
exclusion of any other communications, all wire and electronic
communications carried by the carrier within a service area to or from
equipment, facilities or services of a subscriber of such carrier
concurrent with their transmission to or from the subscriber's service,
facility or equipment or at such later time as may be acceptable to the
government;
(ii) expeditiously isolate and enable the government to access call
identifying information which is reasonably available to the carrier
--
(1) either before, during or immediately after the transmission of a wire
or electronic communication (or at such later time as may be acceptable to
the government); and
(2) in a manner that allows it to be associated with the communication to
which it pertains,
except that, with regard to information acquired solely pursuant to the
authority for pen registers and trap and trace devices as defined in
chapter 206 of this title, such call identifying information shall not
include any information that may disclose the physical location of the
subscriber, beyond what may be determined from the telephone number;
(iii) deliver intercepted communications and call identifying information
to the government in a format such that they may be transmitted by means of
facilities or services procured by the government to a location away from
the premises of the carrier; and

(iv) facilitate authorized communications interceptions and call identifying information access unobtrusively and with a minimum of interference with any subscriber's telecommunications service and in a manner that protects the privacy and security of communications and call identifying information not authorized to be intercepted and protects information regarding the government's interception of communications and access to call identifying information.

"(b) LIMITATIONS. This chapter does not authorize any law enforcement agency or officer to require the specific design of features or system configurations to be adopted by providers of wire or electronic communication service, nor does it authorize any law enforcement agency or officer to prohibit the adoption of any feature or service by providers of wire or electronic communication service. The requirements of subsection (a) do not apply to (i) information services or (ii) services or facilities that support the transport or switching of communications for the sole purpose of interconnecting telecommunications carriers or private networks.

"(c) EMERGENCY OR EXIGENT CIRCUMSTANCES. In emergency or exigent circumstances, including but not limited to those described in sections 2518(7), 2518(11)(b) and 3125 of this title or in section 1805(e) of title 50, a carrier may fulfill its responsibilities under subparagraph (a)(iii) by allowing monitoring at its premises if that is the only means of accomplishing the interception or access.

"(d) MOBILE SERVICE ASSISTANCE REQUIREMENTS. A telecommunications carrier offering a feature or service that allows subscribers to redirect, hand off, or assign their wire or electronic communications to another service area or another service provider, or to utilize facilities in another service area or of another service provider, shall ensure that, when the carrier that had been providing assistance for the interception of wire or electronic communications or access to call identifying information pursuant to a court order or lawful authorization no longer has access to the content of such communications or call identifying information within the service area where interception has been occurring as a result of the subscriber's use of such feature or service, information is available to the government, either before, during or immediately after the transfer of such communications, identifying the provider of wire or electronic communication service that has acquired access to the communications.

"Sec. 2602. Notice of capacity requirements.

"(a) NOTICE OF MAXIMUM AND INITIAL CAPACITY REQUIREMENTS. Within one year from the date of enactment of this Act, and after consulting with state and local law enforcement agencies, telecommunications carriers, providers of telecommunications support services, and manufacturers of telecommunications equipment, the Attorney General shall publish in the Federal Register and provide to appropriate telecommunications carrier associations, standards bodies and fora --

(i) notice of the maximum capacity required to accommodate all the communications interceptions, pen registers and trap and trace devices that the Attorney General estimates government agencies authorized to conduct electronic surveillance may conduct and use simultaneously; and

(ii) notice of the number of all communications interceptions, pen

registers, and trap and traces devices, representing a portion of the maximum capacity set pursuant to (a)(i), that the Attorney General estimates government agencies authorized to conduct electronic surveillance may conduct and use simultaneously four years from the date of enactment of this Act.

Such notices may be based upon the type of equipment, type of service, number of subscribers, geographic location, or other measure.

"(b) COMPLIANCE WITH CAPACITY NOTICES. Within three years of the publication by the Attorney General of a notice of capacity needs, or within four years from the date of enactment of this Act, whichever is longer, a telecommunications carrier shall ensure that its systems are capable of --

(i) expanding to the maximum capacity set forth in the notice provided pursuant to section (a)(i); and

(ii) accommodating simultaneously the number of interceptions, pen registers and trap and trace devices for which notice has been provided pursuant to section (a)(ii).

Thereafter, a telecommunications carrier shall ensure that it can accommodate expeditiously any increase in the number of interceptions, pen registers and trap and trace devices that authorized agencies may seek to conduct and use, up to the maximum capacity specified pursuant to section (a)(i).

"(c) PERIODIC INCREASES IN NOTICE OF MAXIMUM CAPACITY REQUIREMENTS. The Attorney General shall periodically provide to telecommunications carriers written notice of any necessary increases in the maximum capacity specified pursuant to section (a)(i). Within three years after receiving written notice of such increased capacity requirements, or within such longer time period as may be specified by the Attorney General, a telecommunications carrier shall ensure that its systems are capable of expanding to the increased maximum capacity set forth in such notice.

"Sec. 2603. Systems security and integrity.

"A telecommunications carrier shall ensure that any court ordered or lawfully authorized interception of communications or access to call identifying information effected within its switching premises can be activated only with the affirmative intervention of an individual officer or employee of such carrier.

"Sec. 2604. Cooperation of equipment manufacturers and providers of telecommunications support services.

"A telecommunications carrier shall consult, as necessary, in a timely fashion with manufacturers of its telecommunications transmission and switching equipment and its providers of telecommunications support services for the purpose of identifying any service or equipment, including hardware and software, that may require modification so as to permit compliance with the provisions of this chapter. A manufacturer of telecommunications transmission or switching equipment and a provider of telecommunications support services shall, on a reasonably timely basis and at a reasonable charge, make available to the telecommunications carriers using its equipment or services such modifications as are necessary to permit such carriers to comply with the provisions of this section.

"Section 2605. Technical requirements and standards for

implementation of section 2601 requirements.
"(a) SAFE HARBOR. To ensure the efficient and industry-wide implementation of the requirements established in section 2601 of title 18, United States Code, the Attorney General, in coordination with other Federal, State, and local law enforcement agencies, shall consult with appropriate associations and standards setting bodies of the telecommunications industry. A telecommunications carrier shall be in compliance with the capability requirements of section 2601 if it is in compliance with publicly available technical requirements or standards which meet the requirements of section 2601 adopted by an industry association or standards setting body. The absence of technical requirements or standards for implementing the requirements of section 2601 shall not preclude any carrier from deploying a technology or service nor shall the absence of standards relieve any carrier of the obligations imposed by section 2601.
"(b) FCC AUTHORITY. In the event of a dispute about technical requirements or standards or if industry associations or bodies fail to issue technical requirements or standards, any person may petition the Federal Communications Commission to establish, by notice and comment rulemaking or other such proceedings as it may be authorized to conduct, specifications or standards that meet the requirements established in section 2601 of title 18, United States Code, protect the privacy and security of communications not authorized to be intercepted, and serve the policy of the United States to encourage the provision of new technologies and services to the public. In a proceeding under this section initiated by a telecommunications carrier, manufacturer of telecommunications transmission and switching equipment, or provider of telecommunications support services, the Commission, to recover the costs of its actions under this section, may assess and collect a fee against the carriers, manufacturers or providers that are parties to the proceeding. Such fee shall be deposited as an offsetting collection in, and credited to, the account providing appropriations to carry out the functions of the Commission and shall be available without fiscal year limitation.
"(c) EXTENSION OF COMPLIANCE DATE FOR FEATURES AND SERVICES. A telecommunications carrier proposing to deploy, or having deployed, a feature or service within four years after the date of enactment of this Act may petition the Commission for one or more extensions of the deadline for complying with the requirements established in section 2601 of title 18, United States Code. The Commission may, after affording a full opportunity for hearing and after consultation with the Attorney General, grant an extension under this paragraph, if it determines that compliance with the requirements of section 2601 of title 18, United States Code, is not reasonably achievable through application of technology available within the compliance period. An extension under this paragraph shall extend for no longer than the earlier of (i) the date determined by the Commission as necessary for the carrier to comply with the requirements of section 2601 of title 18, United States Code; or (ii) in no event beyond two years after the date on which the initial extension is granted. An extension under this subsection shall apply to only that part of the carrier's business on which the new feature or service is used.
"Sec. 2606. Enforcement orders.

"(a) If a court authorizing an interception under chapter 119, under a State statute, or under the Foreign Intelligence Surveillance Act, or authorizing use of a pen register or a trap and trace device under chapter 206 or under a state statute finds that a telecommunications carrier has failed to comply with the requirements in this chapter, the court may direct that the carrier comply forthwith and may direct that a provider of support services to such carrier or the manufacturer of the carrier's transmission or switching equipment furnish forthwith modifications necessary for the carrier to comply.
"(b) The Attorney General may apply to the appropriate United States District Court for, and the District Courts shall have jurisdiction to issue, an order directing that a telecommunications carrier, a provider of telecommunications carrier support services or a manufacturer of telecommunications transmission or switching equipment comply with this chapter.
"(c) A court shall issue an order under subsections (a) or (b) only if it finds that --
(i) alternative technologies or capabilities or the facilities of another carrier are not reasonably available to law enforcement for implementing the interception of communications or access to call identifying information; and
(ii) compliance with the requirements of this chapter is reasonably achievable through the application of available technology to the feature or service at issue or would have been reasonably achievable if timely action had been taken.
A court may not issue an order where the government's demands for interception of communications and acquisition of call identifying information exceed the capacity for which notice has been provided under section 2602.
"(d) A court issuing an order under this section may impose a civil penalty of up to $10,000 per day for each day in violation after the issuance of the order or after such future date as the court may specify. In determining whether to impose a fine and in determining its amount, the court shall take into account the nature, circumstances, and extent of the violation, and, with respect to the violator, ability to pay, good faith efforts to comply in a timely manner, effect on ability to continue to do business, the degree of culpability or delay in undertaking efforts to comply, and such other matters as justice may require. The Attorney General may file a civil action in the appropriate United States District Court to collect, and the United States District Courts shall have jurisdiction to impose, such fines.
"Sec. 2607. Definitions.
"As used in this chapter --
"(1) the terms defined in section 2510 of this title have, respectively, the definitions given such terms in that section; "(2) 'telecommunications carrier' means any person or entity engaged in the transmission or switching of wire or electronic communications as a common carrier for hire, as defined by section 3(h) of the Communications Act of 1934, and includes (i) any person or entity engaged in providing commercial mobile service, as defined in section 6002(b) of Public Law 103-66, and

(ii) any person or entity engaged in providing wire or electronic communication switching or transmission service to the extent that the Commission finds that such service is a replacement for a substantial portion of the local telephone exchange service and that it is in the public interest to deem such person or entity to be a common carrier for purposes of this Act.

"(3) 'provider of telecommunications support services' means any person or entity that provides products, software, or services to a telecommunications carrier that are integral to the switching or transmission of wire or electronic communications;

"(4) 'government' means the Government of the United States and any agency or instrumentality thereof, the District of Columbia, any commonwealth, territory or possession of the United States, and any state or political subdivision thereof authorized by law to conduct electronic surveillance;

"(5) 'information services' means the offering of a capability for generating, acquiring, storing, transforming, processing, retrieving, utilizing, or making available information via telecommunications, and includes electronic publishing, but does not include any use of any such capability for the management, control or operation of a telecommunications system or the management of a telecommunications service;

"(6) 'call identifying information' means all dialing or signalling information associated with the origin, direction, destination, or termination of each communication generated or received by the subscriber equipment, facility or service of such carrier that is the subject of a court order or lawful authorization, but does not include any information that may disclose the physical location of the subscriber beyond what may be inferred from the telephone number."

SECTION 2. EFFECTIVE DATE. Sections 2601 and 2603 of title 18 as added by section 1 of this Act shall take effect four years after the date of enactment of this Act. Unless otherwise specified, all other provisions of this Act shall become effective on the date of enactment.

SECTION 3. REIMBURSEMENT AND FUNDING.

(a) The Attorney General shall reimburse telecommunications carriers for all reasonable costs directly associated with (1) the modifications performed by carriers prior to the effective date of section 2601 or prior to the expiration of any extension granted under section 2605(c) of title 18, United States Code, as added by this Act, to establish the capabilities necessary to comply with section 2601; (2) establishing the maximum capacity requirements set pursuant to section 2602 of title 18; and (3) expanding existing facilities to accommodate simultaneously the number of interceptions, pen registers and trap and trace devices for which notice has been provided pursuant to section 2602. Notwithstanding any other provision of law, the Attorney General is authorized to establish any procedures and regulations deemed necessary to effectuate timely and cost-efficient reimbursement to telecommunications carriers for reimbursable costs incurred under this Act, under chapters 119 and 121 of Title 18, United States Code, and under the Foreign Intelligence Surveillance Act. If there is a dispute between the Attorney General and a telecommunications carrier regarding the amount of reasonable costs to be

reimbursed, the dispute shall be resolved and the amount determined, in a proceeding initiated at the Federal Communications Commission under section 2605 of title 18 or by the court from which an enforcement order is sought under section 2606.
(b) For fiscal years 1995 through 1998, there are authorized to be appropriated a total of $500,000,000. For fiscal years 1999 and thereafter, there are authorized to be appropriated such sums as may be necessary to carry out the purposes of this Act.
(c)(i) On or before November 30, 1995, and on or before the same day each year for five years thereafter, the Attorney General shall submit to the Congress a report on the amounts paid during the preceding fiscal year in reimbursement to carriers for costs incurred in making modifications to comply with the provisions of this Act. Said reports shall include but not be limited to (1) a detailed accounting of the amounts paid to each carrier and the technology, feature or service for which the amounts were paid and (2) projections of the amounts expected to be paid in the then ongoing fiscal year, the carriers to which reimbursement is expected to be paid, and the technologies, services, or features for which reimbursement is expected to be paid.
(ii) On or before April 1, 1996 and April 1, 1998, the General Accounting Office shall, after consultation with the Attorney General and the telecommunications industry, submit to the Congress a report reflecting its audit of the sums paid by the Attorney General to carriers in reimbursement. Such report shall include the findings and conclusions of the Comptroller General on the costs to be incurred after the compliance date, including projections of the amounts expected to be incurred and the technologies, services, or features for which expenses are expected to be incurred.
SECTION 4. DEFINITION.
Section 2510(4) of title 18 is amended by adding at the end thereof, before the semicolon, ", except that with regard to the transmission of a communication encrypted by a subscriber, a telecommunications carrier shall not be responsible for decrypting, or ensuring the government's ability to decrypt, the communication, unless the encryption was provided by the service provider and the service provider possesses the information necessary to decrypt the communication".
SECTION 5. CORDLESS TELEPHONES.
(a) Definitions. - Section 2510 of title 18, United States Code, is amended -
(1) in paragraph (1), by striking "but such term does not include" and all that follows through "base unit"; and
(2) in paragraph (12), by striking subparagraph (A) and redesignating subparagraphs (B) through (D) as subparagraphs (A) through (C) respectively.
(b) Penalty. - Section 2511 of title 18, United States Code, is amended -
(1) in subsection (4)(b)(i), by inserting "a cordless telephone communication that is transmitted between the cordless telephone handset and the base unit," after "cellular telephone communication,"; and
(2) in subsection (4)(b)(ii), by inserting "a cordless telephone

communication that is transmitted between the cordless telephone handset and the base unit," after "cellular telephone communication,".
SECTION 6. RADIO-BASED DATA COMMUNICATIONS.
Section 2510(16) of title 18, United States Code, is amended by striking the word "or" at the end of subparagraph (D) and inserting an "or" at the end of subparagraph (E) and adding the following new subparagraph:
"(F) an electronic communication;"

SECTION 7. PENALTIES FOR MONITORING RADIO COMMUNICATIONS THAT ARE NOT SCRAMBLED, ENCRYPTED, OR NON-PUBLIC.
Section 2511(4)(b) of title 18, United States Code is amended by deleting the phrase "or encrypted, then -" and inserting the following:
", encrypted, or transmitted using modulation techniques whose essential parameters have been withheld from the public with the intention of preserving the privacy of such communication, then -"
SECTION 8. TECHNICAL CORRECTION.
Section 2511(2)(a)(i) of title 18 is amended by striking out "used in the transmission of a wire communication" and inserting in lieu thereof "used in the transmission of a wire or electronic communication".

SECTION 9. FRAUDULENT ALTERATION OF COMMERCIAL MOBILE RADIO INSTRUMENTS.
(a) Section 1029(a) of title 18 is amended by striking the word "or" at the end of subparagraph (3) and adding the following new subparagraphs:
"(5) knowingly and with intent to defraud uses, produces, traffics in, has control or custody of, or possesses a telecommunications instrument that has been modified or altered to obtain unauthorized use of telecommunications services; or
"(6) knowingly and with intent to defraud uses, produces, traffics in, has control or custody of, or possesses (i) a scanning receiver or (ii) hardware or software used for altering or modifying telecommunications instruments to obtain unauthorized access to telecommunications services."
(b) Section 1029(c)(2) of title 18 is amended by striking "(a)(1) or (a)(4)" and inserting in lieu thereof "(a)(1), (a)(4), (a)(5) or (a)(6)".
(c) Section 1029(e)(1) of title 18 is amended by inserting "electronic serial number, mobile identification number, personal identification number, or other telecommunications service, equipment, or instrument identifier," after "account number,".
(d) Section 1029(e) of title 18 is amended by striking the word "and" at the end of subparagraph (5), by striking the period at the end of subparagraph (6) and adding "; and", and by adding the following new subparagraph:
"(7) the term 'scanning receiver' means any device or apparatus that can be used to intercept a wire or electronic communication in violation of chapter 119 of this title."

SECTION 10. TRANSACTIONAL DATA.
(a) Section 2703(c)(1)(B) of title 18, United States Code, is amended by adding at the end thereof the following:

"Records or other information disclosed under this subparagraph shall not include any interactive information generated by the subscriber or customer or any information identifying services used by the subscriber or customer, except the dialling or signalling information utilized in call or message processing.";
(b) Section 3121 of title 18, United States Code, is amended by redesignating subsection (c) as (d), and adding a new subsection (c) as follows:
"(c) Limitation. -- A government agency authorized to install and use a pen register under this chapter, or under state law, shall use technology reasonably available to it that restricts the recording or decoding of electronic or other impulses to the dialling and signalling information utilized in call processing."

SECTION 11. REPORTING OF INTERCEPTIONS ENCOUNTERING ELECTRONICALLY ENCRYPTED COMMUNICATIONS.
Section 2519(2) of title 18, United States Code, is amended by deleting everything after the semicolon in subparagraph (f) and inserting the following:
"(g)the number of interceptions encountering electronically encrypted communications, specifying the number of such interceptions that could not be decrypted; and
"(h)The information required by paragraphs (b) through (g) of this subsection with respect to orders or extensions obtained in a preceding calendar year."

In article <323smd$i35@ionews.io.org>, Gleb Esman wrote:
> Question to radio professionals:
> How is it possible to detect a radar detector? As far as I know

A radar detector is a radio receiver. Like many radio receivers, the radar detector uses the "Superheterodyne" type of circuit. In this circuit, the incoming signal is mixed with another radio frequency signal; the output from the mixer is at a lower frequency than the original signal and thus is easier to work with.

A radar detector detector would work by looking for the Intermediate Frequency (IF) which is generated within the radar detector. It would have to be a very sensitive receiver, since the IF is not a very strong signal. But it is definitely feasible to do this.

362. Recoton WR200 Cordless Headphone sale

Those of you who live in Canada may wish to buy a Recoton WR200 cordless headphone system for use with your scanner. These units are on sale at half price ($50) at The Bay (at the downtown Calgary store at least). The system consists of a transmitter with a 4" whip antenna, battery-powered receiver with a belt clip, and stereo headphones (included).

The great advantage of this sytem over the newer WR400(?) model is that the receiver is separate from the headphones so you can use any headphones, earplugs, or speakers for monitoring. The antenna can also be unscrewed and replaced (the whip from my Radio Shack Pro-2032 fits perfectly).

As a bonus, the 913-914 MHz receiver picks up other voice communications. I heard full duplex two-way conversations. I think the receiver unit is getting image frequencies from 900 MHz cordless phones.

363. Radio! Magazine

I just picked up a new magazine called Radio! that radio shack is selling for $1.95. Since its one of those paid-commercial-advertisements-turned-magazine type things I almost didn't even give it second notice. However, it turns out that if you wade through the ads and stomach the fact that the writers are trying to act like they're not associated with RS, you will find some useful info, especially for beginners. Here's some of the topics covered:

1) Scanning the Action Bands - Basic scanning history and use
2) You can hear WHAT on a scanner - NASA, satellite freqs
3) Pro-2006 Review
4) Shortwave - the Great Radio Escape - shortwave tech descript & freqs
5) Tuning Aircraft, Military stations on shortwave
6) AM broadcast band listening
7) DX-390 Review
8) Radio Codes - APCO,Phonetics lists
9) HTX-404 Review
10) No-licens 49 Mhz communications (TRC-503 plug)
11) The Radio Spectrum - beginner desc of radio spectrum
12) What is World Time?
13) Souping up your scanner - antennae addons
14) DX Shortwave antennae
15) 22-305 Review
16) Buying a CB Radio

Anyway, not for everyone, but worth the 1.95 to me...

A Guide to Scanner Antennas.
by Mike Diaz

There have been many questions regarding how to select an antenna for scanning. This is a Readers' Digest version of antennas, meant to give new users some idea of the different antennas and their good and bad points. At the end, I give some recommendations on how to build a general purpose VHF/UHF antenna system. This is not an all inclusive book on antennas, but rather a guide for novices in their quest to learn more about their scanning hobby. What's the best antenna? There would seem to be as many different answers, as there are people asking the question. Everybody has a favorite band that they listen to, and different antennas work better on different frequencies. But the fact is, the general principles remain the same for everybody. The object of an antenna SYSTEM, is to deliver as much signal as possible to the antenna jack on the back of the radio at the frequency you're listening to. Notice I wrote system; the antenna is a system comprised of several parts: the antenna, the lead-in cable, and the mast or tower to hold it up.

1) ANTENNAS
There are MANY different and very good antennas on the market. There are also some bad ones out there. Antennas are where the most compromises must be made. If you have unlimited room , and very deep pockets, you can put up an antenna farm with a different antenna and radio for each band that you listen to, and not have to compromise. But if you're like the rest of us, you WILL compromise. If you only listen to one band, then your best bet is an antenna designed specifically for that band. Something like a 1/4 wave ground plane, or a 1/2 wave dipole antenna is a good choice for omni-directional listening at a low cost. It will have the added benefit of being less efficient out of band, which if you live in a dense signal environment, may attenuate those intermod producing signals somewhat.

1/4 WAVE GROUND PLANE antenna
This is a single band vertically polarized antenna that offers about 3dB of gain in a relatively narrow frequency range. Its major benefits are its low cost and small size. The ground plane isolates your antenna from having to be coupled to earth ground at a specific multiple of the wavelength, by simulating ground with the radially mounted elements around the bottom. A car mounted antenna is typically a 1/4 wave that uses the body of the car for its ground plane. There are some versions that have several vertical elements (like the R.S. "Allband" with 3) but each vertical element will only be resonant in one band. While it will receive signals in all bands , it will only be efficient in the 3 bands that the

vertical elements are cut to resonate at. R.S.�s all-band is a good antenna if you have a limited number of bands you listen on, they used to sell it as a tri-band, which it is. It�s reasonably priced and gives good performance on 3 popular frequency bands and is usable on the other bands as well.

DISCONE antenna
This is a relative of the 1/4 wave ground plane antenna optimized for wide frequency bandwidth. It offers 3-6dB of gain, but on frequencies above ~120-1300MHz, and with a vertical element on top it is usable down to about 40MHz. The gain is achieved by compressing the radiation pattern into a donut shape with little of the signal radiating upwards or downwards, concentrating the pattern perpendicular to the vertical axis of the antenna. It�s called a discone because it is comprised of two parts, the disc, a group of elements parallel to the ground on top, and the cone, the radial elements around the bottom that form the ground plane. These could be made from a solid metal disc and a cone shaped sheet metal radial, and perform the same, but the wind loading would be increased. The Diamond D130J and the Sigma SE1300 are good discones for general purpose scanning. My personal experience with the Radio Shack discone antenna at home, has shown that it is not a very good implementation of the discone design and should be avoided. I believe that the discone is the best all band antenna, it really works. I don�t see ANY other type of omni-directional antenna usable for TRANSMITTING on ALL VHF and UHF ham bands (50, 144, 220, 432, 900, & 1200 MHz) like the discone is. It would be usable on all frequencies in between, too, but that�s illegal, if you�re transmitting as an amateur. I have built many UHF data and voice links (and other things) for the US Gov�t over the years and we use discone antennas for the 225-400MHz military UHF band; the VSWR is consistent and low across the entire band.

1/2 WAVE DIPOLE antenna
This is also a single band antenna that offers 2dB of gain in a relatively narrow frequency range. The dipole antenna is the standard against which gain is measured on all antennas, and it is twice as long as a 1/4 wave antenna. It has balanced signal and ground sides, which means that the coax feed is in the center of the antenna. The center conductor is hooked to the top half and the shield connects to the lower half. It requires a balun to connect it to coax cable, although there are feed techniques that can do the job of matching the antenna to the 50 ohm coax. It is fairly large for the frequency it�s tuned to, and like the ground plane antenna, it isolates your antenna from having to be coupled to earth ground at a specific multiple of the wavelength, by simulating ground with the lower half of the antenna. The dipole can be oriented either vertically or horizontally.

YAGI beam antenna
Named after it�s inventors Yagi and Uda (the second guy always loses out), is another single band antenna that offers 10-25dB of gain and 15-30dB of front-to-back isolation in a relatively narrow frequency range. It is a

group of dipoles all the same length, connected to a boom, to hold them a specific distance apart. It offers excellent gain, and front-to-back isolation and a narrow beam width that it will receive from. You will need a rotor to point it in the right direction, if you want to listen in more than one direction. The down side is, it will only have gain in a narrow frequency range of about +/-1% of the center frequency, which would be beneficial in a dense signal environment, or if you only listen on one band. It is most commonly used by commercial and amateur operators since it is inexpensive and a very efficient type of antenna for single band, point to point, communication in the VHF/UHF range.

LOG PERIODIC beam antenna
The Logarithmicly Periodic Dipole Array is a beam antenna optimized for wide frequency bandwidth. It offers 5-15dB of gain with a moderate 10-15dB of front-to back ratio; the beam width is fairly wide when compared to a Yagi. It is a group of dipoles of decreasing size (with the longest in back and the smallest in front), connected to a boom, to hold them a specific distance apart. The tapering of the elements is what gives it the wide frequency range, by always providing an element that resonates near the frequency that your operating on. It is most commonly used in TV antennas, where operation on many frequencies is required. The down side is that the LPDA can be fairly large for a VHF/UHF antenna. There are commercial versions available that provide general coverage. Create Labs makes two models for $175 & $250. EEB and Ham Radio Outlet both have them in their catalogs.

TV antennas
A TV antenna is NOT a very good scanner antenna because it is optimized only for the TV bands. If you look closely at a TV antenna you will notice that the taper of the elements is not uniform. There will be several long ones (Chan 2-6 at 54-88MHz) then several medium long ones, often interspersed with the long ones (Chan 7-13 at 175-216MHz), and then a bunch of short ones, all the same length (UHF 470-812MHz). The missing elements are for the frequencies that a scanner user wants, but are not in the TV band, so they are not included in the design. If the frequencies that you do listen to are close to the TV bands, then after re-orienting a TV antenna to vertical polarization, it may work, but I'll bet it doesn't work very well. Another problem is, the UHF elements on a TV antenna are ALWAYS a Yagi design. The reception range that they advertise is only on one channel (my guess is around Chan 35 at 600MHz) and the gain falls off the farther you get from that center channel. There are no scanner type signals anywhere near this frequency and a Yagi is a tuned frequency antenna. You will NEVER see a gain Vs frequency plot of any TV antenna from the manufacturer. This is why TV antennas make lousy scanner antennas. If you want to use a wide band UHF TV antenna, try a 4-bay bow tie, it has about 6dB of gain, a 15dB front-to-back ratio and resonates across a wide frequency range. The whole antenna just needs to be re-oriented to vertical polarization. On VHF, don't bother. I am not aware of any true broad band LPDA TV antenna, they are always optimized only for TV frequencies, they are missing elements resonating in the

88-175MHz and 216-470MHz regions.

2) Lead-in CABLE
It doesn't matter how good your antenna is, if you are feeding it with lossy COAX.
The loss that a COAX has, is determined by many factors, most having to do with the density and effectiveness of the shield and the dielectric (the insulator in the center). If the shield is not very good, more of the signal will be lost before it gets to your radio, and you will be susceptible to multipath distortion in strong signal environments. If the dielectric is made wrong the impedance of the COAX will vary. The problem is the quality of the cable itself, this is something that you can't see or discern from the specs, RG-8 is RG-8 right? WRONG, because it is a manufacturing process, if the machines that manufacture it are not set-up properly, or the materials used are sub-standard, the result will be BAD COAX. Cheap COAX may have a 98% shield in it's specs but it won't be consistent across the entire length of the cable. Sometimes there will be areas several feet long with large gaps with only a few strands in the shield. There is no way to tell from outside the cable that something is wrong. The same for the dielectric, if it's uneven the characteristic impedance of the COAX will vary tremendously. The result is you just won't hear as many signals at the higher frequencies. That is why you should always buy name brand cable from a reputable manufacturer.
Frequency is the other MAJOR contributing factor in determining your losses. The higher the frequency, the higher the loss. If you only listen to the California Highway Patrol, in the 39-45MHz band, then a VHF 1/4 wave ground plane antenna and any kind of COAX will do, such as RG58, which is easily routed, and not very expensive. The same is true if you listen only to railroads or police/fire in the 150MHz band. A single band 1/4 or 1/2 wave and the better RG8 cable will be plenty good enough. But if you listen to the 800MHz trunked band you can significantly improve your reception, by just using better COAX. I use Heliax on my system for maximum performance. I've included a chart of some common COAXs and their loss at different frequencies for comparison.
These are from the Belden Wire and Cable catalog, except for the Heliax.

Losses in dB per 100ft

	50MHz	100MHz	500MHz	900MHz
RG-58A/U	3.3	4.9	13.3	20.0
RG-8/U	1.2	1.8	4.7	6.7
Belden 9913	0.9	1.4	2.9	4.2
1/2" Heliax	0.56	0.83	2.0	2.8

Note: The losses scale proportionally with length. Half as long, half the loss.

3) The MAST or TOWER
There is no substitute for height, until you've cleared the obstructions around your house. After you have cleared any obstructions more height

will give only slightly improved range. Remember line-of-sight won't change much with another 10 or 20 feet of elevation. It takes 100's or 1000's of feet of elevation to really make a difference.
I don't know much about lightning protection, since here is Silicon valley we rarely ever get any lightning, maybe once every 5 years. I saw some just last winter, or was it the winter before. Anyway don't forget to ground your system as appropriate.

My RECOMENDATIONS
I think most of us listen on many different bands, so a single band antenna just won't cut it. One antenna with good performance on all bands is the best solution. I personally have chosen a Diamond D130J discone antenna, and I am very pleased with its performance. The Sigma SE1300 has the same performance but costs a little more. I would recommend RG8/U or Belden 9913 low loss COAX as your best bet, the Belden is much more expensive. I got my Heliax, surplus and cheap. I swept it using an HP network analyzer to be sure it was still good. For a mast, no more than 10-20ft above the roof is necessary to clear most obstructions, such as neighbors' houses and trees. More than that will give only a marginal improvement in receiving range and make the installation more difficult.

Multiple radios
I've connected all of my radios to one antenna with the use of a 4-way splitter. This is not a cheap R.S. splitter but a commercial quality hybrid type from Mini Circuits with guaranteed specs from 1 to 2000MHz. I lose 6dB of signal but it's worth it to have only one antenna and cable. My ICOM 7100 and both PRO2006s all run from the same antenna and I have an extra spigot that I can use for testing my PRO-43 or any other radio.

If you want more in-depth information, try the ARRL Antenna Handbooks (there's one specifically for VHF/UHF) and check your local library.

Hello all,

I will be going to shcool in Vermont next month and I am planning on taking my scanner (a pro-2006) with me. Can anyone post or e-mail me some frequencies. I will be living in the St-Johnsbury\Lyndonville area.
Thanx in advance.

Bob Robichaud

367. Re: 46 mhz log periodic antenna

Newsgroup: rec.radio.scanner
Date: 1994-08-08 23:13:22 UTC
From: dbashaw@synoptics.com
Message-ID: <Cu8oIB.5CH@synoptics.com>
Source record: 270721

Log Periodic antennas and Yagi's are not the same thing.

Yagi: The antenna is designed to one particular center frequency. Any departures from this center frequency up or down will result in an increase in measured swr. The physical construction of the antenna usually has the elements placed in the following order: reflector(s) : driven element(s) : directors(s) along the boom.

Log Array: Designed to cover a range of frequencies with an acceptable swr. This can be a few (hundred) Khz to a few Mhz. The main difference is the feed method and the element layout. The elements are fed in a criss-cross fashion. The elements are cut in half lengthwise and assembled on the boom so that the feed point for the first element on one side of the boom is connected to the feedpoint of the next preceeding element on the opposite side of the boom. This cross-feed arangement allows a different group of elements to appear resonant as the operating frequency changes.
element placement is the same as for the Yagi.

LogYag: The marrying of the two above types into a single antenna. This would provide an antenna with a good match from say 88-108Mhz.

Any of the above would be a good directional antenna for monitoring cordless phones. The LPDA is not trivial to design. The Yagi is much easier. All require some skill in antenna hacking to get good results. An LPDA would yield the best match across the cordless phone band.

Are there so many phones around you need to be so selective :>)

End of rambling.

My understanding is that these phones use direct sequence spread spectrum.
I was browsing thru a book on this the other day (idly, at the bookstore
while looking for other stuff), and seem to recall reading that dsss is
the easiest mode to sync to. I think you sort of slide your sequence back
and forth over the signal, and when they're synced, the signal gets clear
in an easily detectable way. (Can't remember the details of that, tho).
If you know what you're doing, and have the sequence, it should be easy.
I think there's lots of snake-oil out there involving security of
these phones. When they say "Uses digital spread-spectrum techniques with
64,000 different codes," they may probably be saying that there's one
sequence and 64K access codes to dial out, which is the same as an analog
cordless with 64K security.
-Steve
p.s. There are reports that the audio is transmitted in the clear on 450
MHz. Not sure of the signal level, tho.

369. 900 Mhz Cordless Phones

Newsgroup: rec.radio.scanner

From: ad366@lafn.org
Message-ID: <1994Aug8.232617.27786@lafn.org>
Source record: 270625

Can Anyone out there tell me if there is a study, or report somewhere
that rates the various 900 cordless phones. I've tried several, including
the Escort, which was the best of the ones I tried, but it definately
had it's drawbacks. Also, what about adding an external antenna to the base
unit to increase it's effective range? At 900 Mhz, RF does funny things,
so I'm wondering what the point of diminishing returns is for such a project.
Please email me ad366@lafn.org thanks, Dana

SECTION 9. FRAUDULENT ALTERATION OF COMMERCIAL MOBILE RADIO
INSTRUMENTS.
(a) Section 1029(a) of title 18 is amended by striking the word
"or" at the end of subparagraph (3) and adding the following new
subparagraphs:

"(6) knowingly and with intent to defraud uses, produces, traffics in, has
control or custody of, or possesses (i) a scanning receiver or (ii)
hardware or software used for altering or modifying telecommunications
instruments to obtain unauthorized access to telecommunications services."

Notice how this outlaws cellular capable scanners: now mere possession
is outlawed if this silly bill makes it into law. Of course with a "silly Bill"
in the white house, I wouldn't be surprised if it does get enacted.

Your freedom grabbing Democrats love this act.

"(7) the term 'scanning receiver' means any device or apparatus that can be
used to intercept a wire or electronic communication in violation of
chapter 119 of this title."

>latter isn't even a valid FM channel. I can't imagine the FCC authorizing
>anything but a "Mr. Microphone"-like Part 15 gadget in the FM band, and I don't
>think there's any equivalent to such gadgets for the TV band.

>Are you sure about those three, Patrick? Where did those numbers, specifically,
>come from? Maybe whoever heard these was really listening to images?

"Private Line" operation is when subaudible tones (below the normal voice passband) are used to control squelch. The frequencies mentioned above should be in Hz, NOT MHz. It's audio.

PL "YZ" 82.5 Hz
PL "YB" 88.5 Hz
PL "1Z" 100.0 Hz

There are 36 standard "PL" tones ranging from 67.0 to 256.3 Hertz. "PL" is a Motorola trademark, as is the name, "Pirvate Line". However, calling the tone PL is as common as calling all facial tissue "Kleenex". The generic industry term is Continuous Tone Coded Squelch System or CTCSS. Just about all two way manufacturers support CTCSS options.

Unless you are using a CTCSS decoder for squelch control, PL frequencies won't do anything for you. Decoders are available, but you usually need to get raw audio (like from the discriminator) to make them work - IOW radio surgery. Don't get too excited about this, these decoders won't scan PLs while your radio is scanning frequencies. But if you are only going to listen to one channel...

lately i've become interested in the level of security actually provided by
the 900 mhz spread spectrum phones. for instance, could a hacker with a
pc and a smattering of outboard hardware have a good chance of decoding one's
900MHz phone calls?

does anyone have any details on the ss systems used in, say, the escort
phones? spreading sequence generator, moduation methods, synchronization
schemes, etc.? one of the felows that i talked with at cincinnatti microwave
suggested that their phones choose a spreading sequence randomly whenever the
phone gets used. is this true?

being a ham, i know that the fcc has allowed hams to use one of two linear
feedback shift register schemes to generate the spreading sequence for direct
sequence and frequency hopped systems. this makes it extremely easy to
intercept a transmission. if the phones were this vulnerable then it would
be difficult to make claims of security, eh?

also, since a lot of conversation time is "dead" time - mostly silence - does
this provide the attacker a rather simple way to get the spreading code? i
am assuming that the digitized voice level is mixed with the spreading code
here - maybe someone who has more insight can comment on this method of attack.

if you've got the technical info, please pass it along. i'll post a summary.

Well technically, yes, but prosecutors generally assert that there is
criminal intent whether or not. My reading is that if you want to listen
to cellphones (already an illegal act) and you have a scanner capable of
doing it, then you are in violation of this statute. A zealous prosecutor
would assert that you have this intent if you are simply in possession of
a cellular capable scanner.

It probably goes well beyond cell too. For example, there are commercial
carphones in the VHF band (an old system albeit), and it would appear that
a plain old scanner would pick that up. "Unauthorized access" to me would
include listening to something if you were not intended to be the recipient.
Also included in the VHF bands are the marine operators. Anyway there is
INMARSAT at 1.54ghz and that is telecommunication activity too.

My reading is that simple possession of a receiver or other device
capable of monitoring this stuff would be illegal if the prosecutor
could prove that you knowingly listened to this traffic. I would
even venture a guess that listening to the high seas operator
on HF would fall into that category too.

This stuff is way out of the area of reasonableness. Write
your congresscritters and complain!!!

The only problem I have with this magazine is their reviews. I'd just
love to see a piece of RS equipment get a bad review.
And don't you just love when they say.. "and I find the RS #20-405 is
perfect for the job" .. hehe.. yeah, right.

There is some good history in there.

One item of critical importance I forgot to mention in my previous
post is that it really does not matter if you are guilty or innocent
as far as the law is concerned: if you are arrested and charged, then
you will have to spend a lot of time an money defending yourself.

Having a scanning receiver in your possession will be good enough
to get you arrested by a federal agent if they want to harass you.
Criticizing the president openly might get you on a target list for
example. Think about this, it is really very serious.

So to be arrested, you need not be guilty of anything. Just remember
that.

>does anyone else have this problem?

I think I may be experiencing this same problem. I added a new battery, as a precautionery measure last week. Yesterday, the display went blank. I've had the rs2004 for a long time. Today, after reading your post, and after not thinking to replace the battery as a possible cause, since I just replaced it, I replaced it. And voila! It now works. If it reverts to 'dead' stage, I will have to try the replace-battery-method again. I was wondering if attaching the tape output port to my stereo, which I only very recently did, had anything to do with this. Probably not, probably just the ol' reliable rs2004 is on its way out. Repair costs for labor, as I was told today, run about $35 in a NYC-shop-but, nothing is guaranteed.

I was wondering if anyone out-there knows about life-times for the component electronics, the 'expected life-years' for radio shack components, especially scanner equipment, in particular, the pro-2004?? ...and can most components be replaced, or are some components simply out-of-stock-forever??

Thanks for any responses and good luck with your rs2004, Andrew.

Direct sequences are easy to figure out. (These are single shift register
generators.) If you know how long it is, say N stages, all you need is N+1
bits to figure out the code and the synch.

Mike Diaz (mike_diaz@smtp.esl.com) wrote:

: A Guide to Scanner Antennas.
: by Mike Diaz

Gain is measured relative to a dipole in free-space and targeted at the horizon. The gain of a 1/4 wave ground plane is therefore -3db. Let's compare everything to a ground plane, then we have unity (no-gain). A halfwave vertical (vertical dipole) is +3db, a discone may have some gain but it may not me in the desired listening areas.

Yagi type beam antnnas will have 8 - 13db. A vertical TV antenna will work since the elements are cut for a wide range of frequencies. This wide range will also cause overload problems in some areas.

Hope that helps...

Andy

I recently purchased a new Uniden SportCat 150 and being new to the scanning world I am not sure it is capable of picking up cell phone freqs. From what I have gathered by reading this group, scanners manufactured after April of 1994 are not capable of receiving cell phone transmissions without modifications, right? My question: the date of manufacture stamped on the bottom of the scanner indicates "OCID", anybody know what that means? Is it some kind of code indicating year-month? Anyway, I would appreciate someone telling me what "OCID" means.
Thanks!

Richard Crisp blames President Clinton and the Democrats for the scanner laws...

Mr. Crisp, I think the last thing this group needs is politcal posturing, expecially when it is unsupported by facts. FYI, the anti-scanning laws were written during REPUBLICAN administrations, and you can sure bet that Geo. Bush would have signed them into law had he been elected. Frankly, I think the probably the last thing Clinton has on his mind is scanning, for very good reason. These laws are passed as part of larger groups of FCC regulations, and I'm sure the Pres. doesn't really give a damn about who listens to what. As for your attack against Democrats, let me remind you that the anti-cellular laws, right or wrong, are designed to protect the commercial interests of the cellular industry. And, when it comes to supporting the rights of business over those of citizens, no group does it better than Republicans (although, increasingly, Democrats are doing it, too).

If you're going to blame someone, put it where it belongs: the cellular lobby and the FCC bureaucrats and Congresspeople who listen to them, regardless of which party they belong to. The

I apologize for the political tone of this article, but the continued presence of right-wing polemics on this group has forced me to react. The devil made me do it. And I'm AGAINST the anti-scanning laws, nowmy that I've popped $340 bucks for a Pro-2006. :)

One thing I will say for Mr. Crisp: every time he posts a "For Sale" notice, I start salivating. :)

yes... I reported this late last week... and am still researching it. My
phone though, is the Tropez 900 DL which is not spread-spectrum but
digitally modulated on single carriers within the 900 MHz band. What I
have found is that there is some leakage of in-the-clear audio in the
430 MHz amateur band from the handset. Others have found and reported
similar signals. I am trying to get someone from VTech (the manufacturer
of the phone) to discuss this with me... but they seem to be having trouble
returning my calls.

> in the white house, I wouldn't be surprised if it does get enacted.

I don't see a problem. The first few words say "knowingly AND with intent to defraud". Sure, I possess a scanning receiver, but not with "intent to defraud" anybody. Similarly, Optoelectronics produces hardware and software that modifies scanning receivers -- but not so that they can be used to "obtain unauthorized access to telecom services".

The point of this bill is to target the folks who, from a car next to yours, use a scanner to pick up the NAM and other codes from your cellphone, program their own or someone else's cellphone to mimic yours, and make calls on your tab.

I agree that there's no need for a specific law here, existing laws against wire fraud cover it just fine, but I don't see an "evil freedom-grabbing scanner ban" here either.

Well, for the record, many of us here in NJ did fight the stupidity
and as a result, we have a new scanner law (1992) which doesn't
prohibit scanners anywhere...use a scanner in the car to your
heart's content. The new law is similar to several other
states which make it illegal to use a scanner in the commission of
a crime, etc.

Hope that updates the NJ situation about scanners.

As to the $500 antena registration DEP regulation...that's still
pending and the amateur radio community came out heavily
to oppose any such registration and/or fees. I attended the
hearing in Trenton and the brodacst industry, the commercial
private radio industry and EVERYONE else that spoke was in total
opposition to the fees/registration.

Cheers,

Most run of the mill scanners have such cheap audio chains that the PL
passes through just fine. Just plug in the aftermarket decoder to the
earphone jack. 99% chance all will work fine.

A disturbing proposal to say the least. I have read section 9 over and over and it sure reads as a scanner ban. "...has control or custody of, or possesses (i) a scanning receiver..." is pretty clear. I am not sure that intent is even an important consideration here.

Section 7 seems to me to be just as bad for those who monitor digital modes.

Can anyone supply the frequencies for Sullivan County
police and fire, especially an super-secret simplex
frequencies. Also, if the town of Bethel, N.Y. has
its own force, those frequencies would be neat, also.

My buddy who needs these recalls there were some
forestry allocations used there in the 151 MC range.

>committed?

Criminal intent is a historical artifact in the U.S.A. these days.
We've crossed the line from assuming personal responsibility
to allowing the government to watch over us in all aspects.

Nowadays, simply *being* something or *having* something
all by itself is an actionable offense in more and more
communities. Criminal intent never enters the argument.

Why should it be surprising that they want to make it
illegal to simply have a scanner?

Next, they'll make it illegal to be a white male and
haul my ass off to jail!

Unfortunately, the folks at Icom not only deleted the 800 mhz cellular bands, but the whole range of 800-899.999, including legitimate business band operations, PD freqs, and local services. I really cannot imagine why Icom did this, except that it may have been an easier fix to get their products back to distributors --- but for anyone wanting even to listen to their local PDs on 800 mhz, forget it with these expensive ICOM receivers!

What is this? Netiquette against attacking a "forum god"? I have never heard of such a thing and certainly hope you are not inferring I am a forum god (whatever that is)! My rule of thumb: if you post it, prepare to defend it!

>that the above unqualified generalization by Mr. Crisp, is correct

This is why I have, after many years of being a card carrying Republican, now become a Libertarian. I like the fiscal policies of the Repubs better than the Democrats, but I hate legislated morality and hate firearm ownership restrictions and communication equipment ownership restrictions. Note that each of the traditional parties seems to target their own area of freedoms, for further restrictive legislation. This is why the Libertarians get my support these days.

Political persuasion aside, we must unite to stop this craziness before it becomes law. It is a lot harder to get a law removed from the books once it is enacted than it is to simply prevent its passage.

---ten years in the future in some random senator's office----
"let me see if I understand you, Mr Crisp: you'd like to have the right to purchase a radio receiver capable of monitoring my cellular telephone calls, my cordless telephone calls, and the police dispatches, but you have no intention of listening to any of these now illicit services?"

you get my point by now!

Some months ago I posted a comment that the scanner banning which was underway at the time was the same as the assault weapon bans: targeting "bad" radios (or guns) and going after them. Furthermore I stated that they would not stop with cellular capable radios just like the feds did not stop with machineguns in 1986.

I got an endless flame war started with the major thread being that guns are guns and radios are radios and they are different and ther are no parallels. Well let me bring this up again and bring in a bit of historical data into the picture.

1934 Machineguns, Silencers, sawed off shotguns, etc were required to be registered at the Federal level with a hefty "transfer tax" being levied on any sale of them.

1934 Communications act passed. Among the provisions were classification of wiretaps, listening devices, etc

1968 Ominbus crime act: prohibited mail order sales of guns to non-licensees.

1968 Omnibus crime act: prohibited possession of bugs and other wiretapping/listening devices including "the big ear" (a toy sold which had a microphone and a parabolic dish). Many "wireless microphones" were classified as bugs and could not be sold in finished form

1986 Machine gun ban: prohibited manufacture of machineguns
for sale to civilians

1986 ECPA 86: prohibited listening to cellular telephone
conversations. Probably the singly least enforceable
Federal law on the books

1989 Re-classification of certain "assault weapons" as non-sporting
weapons to prohibit their importation. Drug Czar William
Bennett just did this with no law being passed etc.

1992 Scanner ban passed and signed into law by Bush. Went into
total effect in April 1994

1994 Brady bill passed. Prohibited transfers of handguns to
purchasers without a federally mandated 15 day waiting period.
Named for Jim Brady, President Reagan's Press secretary severely
wounded in the 1981 assassination attempt on Reagan. Curiously
the bill would not have prevented Hinckley from purchasing the
weapon used to wound Brady. Now the crime bill may have
a provision added to it to exempt pawnbrokers from being
subject to the Brady bill. Recall that Hinckley bought
his gun from a pawnbroker in Dallas!

1994 Crime Bill: bans importation, manufacture and sale of
a number of "assault weapons" and large capacity magazines.

1994 Telecommunications security act: bans possession of scanning
receivers.

Wanna guess what comes next?

Here's a hint: When the Nazis took power in Germany, they banned the private
ownership of firearms. Hitler was once quoted saying "you have to
disarm the public as an unarmed public cannot fight back". During the war
it was a crime in Germany (punishable by death) to listen to shortwave
broadcasts.

My predictions: first we get disarmed. The strategy for doing it is to create
mass hysteria by overpublicizing any and all acts of violence committed with
firearms. Ignoring for instance that about 300 people a year die from bee stings
while 80 or so die from assault weapons, 50,000 die from car accidents,
400,000 die from smoking related illnesses etc. Total lack of perspective
when these stats are quoted.

While this is happening, we see the grand plan of preventing us from listening
to the police, by first banning listening to cellphones, then by
banning radios that can listen to cellphones then arguing the precedent is
in place for banning radios capable of tuning certain frequencies, then
a total ban on scanners and other radios capable of being used to monitor
the police.

If they fail this time to get the ban they will try a massive media campaign
to show the American public how criminals will use scanners to listen to the
police to remove the element of surprise and portray hobbyists as perverted

voyeurs etc with no socially redeeming values.

Recall the attempt earlier this year in the state of Illinois to ban the possession of scanners which are powered from batteries. The argument used was that gangs used them to evade the police.

Once this is done virtually all resistance will be neutralized and the "GRAND PLAN" will be in place:

No guns, no radios, no way to fight back, no way to communicate, or organize. No way to practice field operations, no way to communicate privately (oh yes, I forgot to mention that the "cover need" for this new legislation is to allow the feds to wiretap digital communications. The ploy here is that they will be able to catch terrorists this way). Then what do we have when all of this is in place? Well for starters, it will be a very unpleasant environment not unlike the situation the founding fathers sacrificed their lives to do away with: they fought a war to have the freedoms, the checks and balances (including the reservation of the right to own firearms to keep the "ultimate recall" capability in the hands of the people), and the other things that our friends in Washington are slowly whittling away.

This reminds me very strongly of the old tale of how to cook a frog: if you drop one into boiling water it will jump out. If you put it into a pot of cold water and then turn on the heat, by the time it realizes what is going on, it is too late.

Well we are all in the pot and IT IS NEARLY TOO LATE MY FRIENDS.....

Don't be so naive: Remember when the RICO laws were passed to give the Feds teeth to go after the Mafia? (RICO= Racketeer Influenced Corrupt Organizations) Well in recent years overly zealous federal prosecutors have used it against a myriad of things other than Mafia dons.

Bottom line: if you possess a device that could be used to "knowingly with intent to defraud" access telecommunications services in an unauthorized manner, a prosecutor will assert that this is your intention be it or not if he so desires.

You will have to defend yourself at a great cost to you in terms of time money and perhaps a lost job (since you are in jail and or court).

This is a very ambiguous wording in this statute, just the kind of thing that prosecutors love to have in their arsenal.

If you were to listen to the VHF marine operator, you would be "accessing telecommunications services". Since you are not an active participant in the conversation, you are "unauthorized". Since you "could" gain access to information that could be used in a fraudulent act (such as getting a credit card number if someone gives one out over the phone, for example), you could easily be charged with "knowingly with intent to defraud access a telecommunications service in an unauthorized manner".

All it would take is for one person to decide to target you, and your ass is grass! If there were a couple of convictions that stuck, it will be a simple extension to have the FCC declare that all scanning receivers are intended to enable people to use them in a manner to fraudulently gain access to telecommunications services and therefore by a simple amendment to their rules (they are empowered to do this btw), refuse to type certify all scanning receivers.

This must be stopped!

Wasn't one of the main purposes of spread spectrum to make it harder to jam a signal? The encryption is just ancillary, and not that good? The encryption only becomes secure when you use a one time pad...right?

Any (well almost any...) antenna will greatly improve the signal reception
over an indoor telescoping type, providing it is cut for the correct
frequencys of interest and isn't fed with lossy (or lousy :)) cable.

>I got an endless flame war started with the major thread being that
>guns are guns and radios are radios and they are different and ther
>are no parallels. ...

And I'm sure you'll get another round of flames. It's just too hard for most
people to accept that the government is their greatest enemy.

Whether it's guns, drugs, tobacco, scanners, encryption software, model
rockets, lawn darts, or anything else that *might* be used or abused to cause
injury, "they" want to regulate or ban it. The question is "why?"

In a country this size, with a pliable media, it will *always* be possible to
make a case for new regulations. You don't have to wait long for a victim or
criminal to appear, to use them to justify taking away another freedom.

And now I've noticed what they're doing and I don't feel very free any more.

Thank you Rich.

If you really believed that, the content of the law would be irrelevent.

Your hypothesis would make you expect to be arrested under any other
contrived pretext.

For background, I (was) a Goldwater Republican and usually say that "If I
were 6 inches taller, I'd be a Libertarian". I think voting Libertarian
is a tactical error because of the realities of our present two-party
system.

But I see a problem... If we have existing laws that cover these areas, why do we need another one. I can't believe that "the point of this bill is to target folks who"...are already doing something illegal.

There is a dangerous aspect to this that some may be overlooking. I have seen a couple of postings that defend this proposal because of the phrase "to obtain unauthorized access to telecommunications services." What exactly does this mean? It may sound well intended - but later when someone is fighting charges what will the courts say??? Is simple listening to signals going to be considered "unauthorized access"?

Be careful when you defend a proposal for a redundant law. This has the potential to bring broader restrictions.

>
>

How about this for a reason?
So when am I going to get type certification for my newly modded
receivers?
Well this could take a very long time, you see you stil have
800mhz coverage in there, and there is likely to be some additional
legislation coming down the pike that will further restrict 800mhz
coverage (look at the new telecommunications security act [aka scanner ban]).
Tell you what: if you completely block those freqs we will approve them
by the end of the week. And oh by the way, I hear that the government
has several agencies that are looking to buy a few thousand receivers,
I think they may buy American, but perhaps if you cooperate with us, they
will buy Icom.....

I must agree. We are slowly being disarmed, and it's not just handguns
I am talking about.

The citizens of the United States are giving up more and more freedoms,
a little bit at a time. We are too lazy, don't care or just too damned
stupid! We want big brother to take care of us and do not want to be
responsible for our own actions (education, employment, health care, defense,
raising our children, u-pick-the-topic!)

How long before we are the Socialist States of America? On a scale starting
with time zero being 1776 and 100 being socialism, where do you put us
now? Fifty years from now?

Any guesses on how long before a civil war results?

Again the comment was directed toward being ARRESTED. It said nothing about being CONVICTED. The thing to remember here is that a suitably ambiguous law is a very effective harrassment tool. If in the judgement of the officer you are breaking a law, then he has the obligation to arrest you.

It is another matter entirely whether or not you are indicted and or convicted. The beauty of the ambiguous law is that the cop has a very good defense against a lawsuit alleging an unlawful arrest. If the law is ambiguous and subject to interpretation, then he simply claims his understanding of the law was that he needed to arrest you.

See how this works?

And of course you may get to spend lots of time money and potentially risk losing your job if you are arrested in defending yourself.

And eeven if you are not actually arrested, they get to claim the law provided them the tool they needed to have PROBABLE CAUSE that youy were doing something illegal so that they can stop your car or obtain a search warrant. Of course if they do, they may actually find evidence of some illegal activity in the process of ` executing said stop or warrant.

There are many corrupt law enforcement types. Furthermore there
are many corrupt bureaucrats in the executive branch. They do not
like opposition. You figure it out what happens next!

Chances are better than even that those cops also do not like
it that you can own a gun either.

Trouble is that the congressslime are now lending a sympathetic
ear to their complaints now that the Socialists (democrats)
have control of the white house, the house and the senate.
There is nothing to stop them and the media is paving the way
for the grand plan.

: Detector-Detector-Detector!

It's already been done. There's one that I saw in a Truck Stop (in New Mexico I believe). The device connected to the cig. lighter, and you plugged your radar detector into the d-d-detector and anytime it detected a d-detector, it would shut off the power to your radar detector. Thereby, hopefully preventing the d-detector from picking up any signals.

SECTION 9. FRAUDULENT ALTERATION OF COMMERCIAL MOBILE RADIO
INSTRUMENTS.
(a) Section 1029(a) of title 18 is amended by striking the word
"or" at the end of subparagraph (3) and adding the following new
subparagraphs:
"(5) knowingly and with intent to defraud uses, produces, traffics in, has
control or custody of, or possesses a telecommunications instrument that
has been modified or altered to obtain unauthorized use of
telecommunications services; or
"(6) knowingly and with intent to defraud uses, produces, traffics in, has
control or custody of, or possesses (i) a scanning receiver or (ii)
hardware or software used for altering or modifying telecommunications
instruments to obtain unauthorized access to telecommunications services."

Notice how this outlaws cellular capable scanners: now mere possession
is outlawed if this silly bill makes it into law. Of course with a "silly Bill"
in the white house, I wouldn't be surprised if it does get enacted.

Your freedom grabbing Democrats love this act.

"(7) the term 'scanning receiver' means any device or apparatus that can be
used to intercept a wire or electronic communication in violation of
chapter 119 of this title."

DRAFT - August 1, 1994

Notice that two Democrats, Leahy of the Senate and Edwards of the House
are the sponsors. The Democrats just love to infringe your liberties.
Vote those schlocks out of office!

SECTION 1. INTERCEPTING DIGITAL AND OTHER COMMUNICATIONS.
Title 18, United States Code, is amended by adding the following new chapter:
"CHAPTER 120 -- TELECOMMUNICATIONS CARRIER ASSISTANCE TO THE GOVERNMENT
"Sec. 2601. Assistance requirements.
"(a) CAPABILITY REQUIREMENTS. -- Except as provided in subsections (b),
(c) and (d) of this section and subsection (c) of section 2606, a
telecommunications carrier shall ensure that its services or facilities
that provide a customer or subscriber with the ability to originate,
terminate or direct communications have the capability to --
(i) expeditiously isolate and enable the government to intercept, to the
exclusion of any other communications, all wire and electronic
communications carried by the carrier within a service area to or from
equipment, facilities or services of a subscriber of such carrier
concurrent with their transmission to or from the subscriber's service,
facility or equipment or at such later time as may be acceptable to the
government;
(ii) expeditiously isolate and enable the government to access call
identifying information which is reasonably available to the carrier
--
(1) either before, during or immediately after the transmission of a wire
or electronic communication (or at such later time as may be acceptable to
the government); and
(2) in a manner that allows it to be associated with the communication to
which it pertains,
except that, with regard to information acquired solely pursuant to the
authority for pen registers and trap and trace devices as defined in
chapter 206 of this title, such call identifying information shall not
include any information that may disclose the physical location of the
subscriber, beyond what may be determined from the telephone number;
(iii) deliver intercepted communications and call identifying information
to the government in a format such that they may be transmitted by means of
facilities or services procured by the government to a location away from

the premises of the carrier; and
(iv) facilitate authorized communications interceptions and call identifying information access unobtrusively and with a minimum of interference with any subscriber's telecommunications service and in a manner that protects the privacy and security of communications and call identifying information not authorized to be intercepted and protects information regarding the government's interception of communications and access to call identifying information.
"(b) LIMITATIONS. This chapter does not authorize any law enforcement agency or officer to require the specific design of features or system configurations to be adopted by providers of wire or electronic communication service, nor does it authorize any law enforcement agency or officer to prohibit the adoption of any feature or service by providers of wire or electronic communication service. The requirements of subsection (a) do not apply to (i) information services or (ii) services or facilities that support the transport or switching of communications for the sole purpose of interconnecting telecommunications carriers or private networks.
"(c) EMERGENCY OR EXIGENT CIRCUMSTANCES. In emergency or exigent circumstances, including but not limited to those described in sections 2518(7), 2518(11)(b) and 3125 of this title or in section 1805(e) of title 50, a carrier may fulfill its responsibilities under subparagraph (a)(iii) by allowing monitoring at its premises if that is the only means of accomplishing the interception or access.
"(d) MOBILE SERVICE ASSISTANCE REQUIREMENTS. A telecommunications carrier offering a feature or service that allows subscribers to redirect, hand off, or assign their wire or electronic communications to another service area or another service provider, or to utilize facilities in another service area or of another service provider, shall ensure that, when the carrier that had been providing assistance for the interception of wire or electronic communications or access to call identifying information pursuant to a court order or lawful authorization no longer has access to the content of such communications or call identifying information within the service area where interception has been occurring as a result of the subscriber's use of such feature or service, information is available to the government, either before, during or immediately after the transfer of such communications, identifying the provider of wire or electronic communication service that has acquired access to the communications.
"Sec. 2602. Notice of capacity requirements.
"(a) NOTICE OF MAXIMUM AND INITIAL CAPACITY REQUIREMENTS. Within one year from the date of enactment of this Act, and after consulting with state and local law enforcement agencies, telecommunications carriers, providers of telecommunications support services, and manufacturers of telecommunications equipment, the Attorney General shall publish in the Federal Register and provide to appropriate telecommunications carrier associations, standards bodies and fora --
(i) notice of the maximum capacity required to accommodate all the communications interceptions, pen registers and trap and trace devices that the Attorney General estimates government agencies authorized to conduct electronic surveillance may conduct and use simultaneously; and

(ii) notice of the number of all communications interceptions, pen registers, and trap and traces devices, representing a portion of the maximum capacity set pursuant to (a)(i), that the Attorney General estimates government agencies authorized to conduct electronic surveillance may conduct and use simultaneously four years from the date of enactment of this Act.

Such notices may be based upon the type of equipment, type of service, number of subscribers, geographic location, or other measure.

"(b) COMPLIANCE WITH CAPACITY NOTICES. Within three years of the publication by the Attorney General of a notice of capacity needs, or within four years from the date of enactment of this Act, whichever is longer, a telecommunications carrier shall ensure that its systems are capable of --

(i) expanding to the maximum capacity set forth in the notice provided pursuant to section (a)(i); and

(ii) accommodating simultaneously the number of interceptions, pen registers and trap and trace devices for which notice has been provided pursuant to section (a)(ii).

Thereafter, a telecommunications carrier shall ensure that it can accommodate expeditiously any increase in the number of interceptions, pen registers and trap and trace devices that authorized agencies may seek to conduct and use, up to the maximum capacity specified pursuant to section (a)(i).

"(c) PERIODIC INCREASES IN NOTICE OF MAXIMUM CAPACITY REQUIREMENTS. The Attorney General shall periodically provide to telecommunications carriers written notice of any necessary increases in the maximum capacity specified pursuant to section (a)(i). Within three years after receiving written notice of such increased capacity requirements, or within such longer time period as may be specified by the Attorney General, a telecommunications carrier shall ensure that its systems are capable of expanding to the increased maximum capacity set forth in such notice.

"Sec. 2603. Systems security and integrity.

"A telecommunications carrier shall ensure that any court ordered or lawfully authorized interception of communications or access to call identifying information effected within its switching premises can be activated only with the affirmative intervention of an individual officer or employee of such carrier.

"Sec. 2604. Cooperation of equipment manufacturers and providers of telecommunications support services.

"A telecommunications carrier shall consult, as necessary, in a timely fashion with manufacturers of its telecommunications transmission and switching equipment and its providers of telecommunications support services for the purpose of identifying any service or equipment, including hardware and software, that may require modification so as to permit compliance with the provisions of this chapter. A manufacturer of telecommunications transmission or switching equipment and a provider of telecommunications support services shall, on a reasonably timely basis and at a reasonable charge, make available to the telecommunications carriers using its equipment or services such modifications as are necessary to permit such carriers to comply with the provisions of this section.

"Section 2605. Technical requirements and standards for
implementation of section 2601 requirements.
"(a) SAFE HARBOR. To ensure the efficient and industry-wide implementation of the requirements established in section 2601 of title 18, United States Code, the Attorney General, in coordination with other Federal, State, and local law enforcement agencies, shall consult with appropriate associations and standards setting bodies of the telecommunications industry. A telecommunications carrier shall be in compliance with the capability requirements of section 2601 if it is in compliance with publicly available technical requirements or standards which meet the requirements of section 2601 adopted by an industry association or standards setting body. The absence of technical requirements or standards for implementing the requirements of section 2601 shall not preclude any carrier from deploying a technology or service nor shall the absence of standards relieve any carrier of the obligations imposed by section 2601.
"(b) FCC AUTHORITY. In the event of a dispute about technical requirements or standards or if industry associations or bodies fail to issue technical requirements or standards, any person may petition the Federal Communications Commission to establish, by notice and comment rulemaking or other such proceedings as it may be authorized to conduct, specifications or standards that meet the requirements established in section 2601 of title 18, United States Code, protect the privacy and security of communications not authorized to be intercepted, and serve the policy of the United States to encourage the provision of new technologies and services to the public. In a proceeding under this section initiated by a telecommunications carrier, manufacturer of telecommunications transmission and switching equipment, or provider of telecommunications support services, the Commission, to recover the costs of its actions under this section, may assess and collect a fee against the carriers, manufacturers or providers that are parties to the proceeding. Such fee shall be deposited as an offsetting collection in, and credited to, the account providing appropriations to carry out the functions of the Commission and shall be available without fiscal year limitation.
"(c) EXTENSION OF COMPLIANCE DATE FOR FEATURES AND SERVICES. A telecommunications carrier proposing to deploy, or having deployed, a feature or service within four years after the date of enactment of this Act may petition the Commission for one or more extensions of the deadline for complying with the requirements established in section 2601 of title 18, United States Code. The Commission may, after affording a full opportunity for hearing and after consultation with the Attorney General, grant an extension under this paragraph, if it determines that compliance with the requirements of section 2601 of title 18, United States Code, is not reasonably achievable through application of technology available within the compliance period. An extension under this paragraph shall extend for no longer than the earlier of (i) the date determined by the Commission as necessary for the carrier to comply with the requirements of section 2601 of title 18, United States Code; or (ii) in no event beyond two years after the date on which the initial extension is granted. An extension under this subsection shall apply to only that part of the carrier's business on which the new feature or service is used.

"Sec. 2606. Enforcement orders.
"(a) If a court authorizing an interception under chapter 119, under a State statute, or under the Foreign Intelligence Surveillance Act, or authorizing use of a pen register or a trap and trace device under chapter 206 or under a state statute finds that a telecommunications carrier has failed to comply with the requirements in this chapter, the court may direct that the carrier comply forthwith and may direct that a provider of support services to such carrier or the manufacturer of the carrier's transmission or switching equipment furnish forthwith modifications necessary for the carrier to comply.
"(b) The Attorney General may apply to the appropriate United States District Court for, and the District Courts shall have jurisdiction to issue, an order directing that a telecommunications carrier, a provider of telecommunications carrier support services or a manufacturer of telecommunications transmission or switching equipment comply with this chapter.
"(c) A court shall issue an order under subsections (a) or (b) only if it finds that --
(i) alternative technologies or capabilities or the facilities of another carrier are not reasonably available to law enforcement for implementing the interception of communications or access to call identifying information; and
(ii) compliance with the requirements of this chapter is reasonably achievable through the application of available technology to the feature or service at issue or would have been reasonably achievable if timely action had been taken.
A court may not issue an order where the government's demands for interception of communications and acquisition of call identifying information exceed the capacity for which notice has been provided under section 2602.
"(d) A court issuing an order under this section may impose a civil penalty of up to $10,000 per day for each day in violation after the issuance of the order or after such future date as the court may specify. In determining whether to impose a fine and in determining its amount, the court shall take into account the nature, circumstances, and extent of the violation, and, with respect to the violator, ability to pay, good faith efforts to comply in a timely manner, effect on ability to continue to do business, the degree of culpability or delay in undertaking efforts to comply, and such other matters as justice may require. The Attorney General may file a civil action in the appropriate United States District Court to collect, and the United States District Courts shall have jurisdiction to impose, such fines.
"Sec. 2607. Definitions.
"As used in this chapter --
"(1) the terms defined in section 2510 of this title have, respectively, the definitions given such terms in that section; "(2) 'telecommunications carrier' means any person or entity engaged in the transmission or switching of wire or electronic communications as a common carrier for hire, as defined by section 3(h) of the Communications Act of 1934, and includes (i) any person or entity engaged in providing commercial

mobile service, as defined in section 6002(b) of Public Law 103-66, and (ii) any person or entity engaged in providing wire or electronic communication switching or transmission service to the extent that the Commission finds that such service is a replacement for a substantial portion of the local telephone exchange service and that it is in the public interest to deem such person or entity to be a common carrier for purposes of this Act.

"(3) 'provider of telecommunications support services' means any person or entity that provides products, software, or services to a telecommunications carrier that are integral to the switching or transmission of wire or electronic communications;

"(4) 'government' means the Government of the United States and any agency or instrumentality thereof, the District of Columbia, any commonwealth, territory or possession of the United States, and any state or political subdivision thereof authorized by law to conduct electronic surveillance;

"(5) 'information services' means the offering of a capability for generating, acquiring, storing, transforming, processing, retrieving, utilizing, or making available information via telecommunications, and includes electronic publishing, but does not include any use of any such capability for the management, control or operation of a telecommunications system or the management of a telecommunications service;

"(6) 'call identifying information' means all dialing or signalling information associated with the origin, direction, destination, or termination of each communication generated or received by the subscriber equipment, facility or service of such carrier that is the subject of a court order or lawful authorization, but does not include any information that may disclose the physical location of the subscriber beyond what may be inferred from the telephone number."

SECTION 2. EFFECTIVE DATE. Sections 2601 and 2603 of title 18 as added by section 1 of this Act shall take effect four years after the date of enactment of this Act. Unless otherwise specified, all other provisions of this Act shall become effective on the date of enactment.

SECTION 3. REIMBURSEMENT AND FUNDING.

(a) The Attorney General shall reimburse telecommunications carriers for all reasonable costs directly associated with (1) the modifications performed by carriers prior to the effective date of section 2601 or prior to the expiration of any extension granted under section 2605(c) of title 18, United States Code, as added by this Act, to establish the capabilities necessary to comply with section 2601; (2) establishing the maximum capacity requirements set pursuant to section 2602 of title 18; and (3) expanding existing facilities to accommodate simultaneously the number of interceptions, pen registers and trap and trace devices for which notice has been provided pursuant to section 2602. Notwithstanding any other provision of law, the Attorney General is authorized to establish any procedures and regulations deemed necessary to effectuate timely and cost-efficient reimbursement to telecommunications carriers for reimbursable costs incurred under this Act, under chapters 119 and 121 of Title 18, United States Code, and under the Foreign Intelligence Surveillance Act. If there is a dispute between the Attorney General and a

telecommunications carrier regarding the amount of reasonable costs to be reimbursed, the dispute shall be resolved and the amount determined, in a proceeding initiated at the Federal Communications Commission under section 2605 of title 18 or by the court from which an enforcement order is sought under section 2606.
(b) For fiscal years 1995 through 1998, there are authorized to be appropriated a total of $500,000,000. For fiscal years 1999 and thereafter, there are authorized to be appropriated such sums as may be necessary to carry out the purposes of this Act.
(c)(i) On or before November 30, 1995, and on or before the same day each year for five years thereafter, the Attorney General shall submit to the Congress a report on the amounts paid during the preceding fiscal year in reimbursement to carriers for costs incurred in making modifications to comply with the provisions of this Act. Said reports shall include but not be limited to (1) a detailed accounting of the amounts paid to each carrier and the technology, feature or service for which the amounts were paid and (2) projections of the amounts expected to be paid in the then ongoing fiscal year, the carriers to which reimbursement is expected to be paid, and the technologies, services, or features for which reimbursement is expected to be paid.
(ii) On or before April 1, 1996 and April 1, 1998, the General Accounting Office shall, after consultation with the Attorney General and the telecommunications industry, submit to the Congress a report reflecting its audit of the sums paid by the Attorney General to carriers in reimbursement. Such report shall include the findings and conclusions of the Comptroller General on the costs to be incurred after the compliance date, including projections of the amounts expected to be incurred and the technologies, services, or features for which expenses are expected to be incurred.
SECTION 4. DEFINITION.
Section 2510(4) of title 18 is amended by adding at the end thereof, before the semicolon, ", except that with regard to the transmission of a communication encrypted by a subscriber, a telecommunications carrier shall not be responsible for decrypting, or ensuring the government's ability to decrypt, the communication, unless the encryption was provided by the service provider and the service provider possesses the information necessary to decrypt the communication".
SECTION 5. CORDLESS TELEPHONES.
(a) Definitions. - Section 2510 of title 18, United States Code, is amended -
(1) in paragraph (1), by striking "but such term does not include" and all that follows through "base unit"; and
(2) in paragraph (12), by striking subparagraph (A) and redesignating subparagraphs (B) through (D) as subparagraphs (A) through (C) respectively.
(b) Penalty. - Section 2511 of title 18, United States Code, is amended -
(1) in subsection (4)(b)(i), by inserting "a cordless telephone communication that is transmitted between the cordless telephone handset and the base unit," after "cellular telephone communication,"; and

(2) in subsection (4)(b)(ii), by inserting "a cordless telephone communication that is transmitted between the cordless telephone handset and the base unit," after "cellular telephone communication,".

SECTION 6. RADIO-BASED DATA COMMUNICATIONS.

Section 2510(16) of title 18, United States Code, is amended by striking the word "or" at the end of subparagraph (D) and inserting an "or" at the end of subparagraph (E) and adding the following new subparagraph:

"(F) an electronic communication;"

SECTION 7. PENALTIES FOR MONITORING RADIO COMMUNICATIONS THAT ARE NOT SCRAMBLED, ENCRYPTED, OR NON-PUBLIC.

Section 2511(4)(b) of title 18, United States Code is amended by deleting the phrase "or encrypted, then -" and inserting the following:

", encrypted, or transmitted using modulation techniques whose essential parameters have been withheld from the public with the intention of preserving the privacy of such communication, then -"

SECTION 8. TECHNICAL CORRECTION.

Section 2511(2)(a)(i) of title 18 is amended by striking out "used in the transmission of a wire communication" and inserting in lieu thereof "used in the transmission of a wire or electronic communication".

SECTION 9. FRAUDULENT ALTERATION OF COMMERCIAL MOBILE RADIO INSTRUMENTS.

(a) Section 1029(a) of title 18 is amended by striking the word "or" at the end of subparagraph (3) and adding the following new subparagraphs:

"(5) knowingly and with intent to defraud uses, produces, traffics in, has control or custody of, or possesses a telecommunications instrument that has been modified or altered to obtain unauthorized use of telecommunications services; or

"(6) knowingly and with intent to defraud uses, produces, traffics in, has control or custody of, or possesses (i) a scanning receiver or (ii) hardware or software used for altering or modifying telecommunications instruments to obtain unauthorized access to telecommunications services."

(b) Section 1029(c)(2) of title 18 is amended by striking "(a)(1) or (a)(4)" and inserting in lieu thereof "(a)(1), (a)(4), (a)(5) or (a)(6)".

(c) Section 1029(e)(1) of title 18 is amended by inserting "electronic serial number, mobile identification number, personal identification number, or other telecommunications service, equipment, or instrument identifier," after "account number,".

(d) Section 1029(e) of title 18 is amended by striking the word "and" at the end of subparagraph (5), by striking the period at the end of subparagraph (6) and adding "; and", and by adding the following new subparagraph:

"(7) the term 'scanning receiver' means any device or apparatus that can be used to intercept a wire or electronic communication in violation of chapter 119 of this title."

SECTION 10. TRANSACTIONAL DATA.

(a) Section 2703(c)(1)(B) of title 18, United States Code, is

amended by adding at the end thereof the following:
"Records or other information disclosed under this subparagraph shall not include any interactive information generated by the subscriber or customer or any information identifying services used by the subscriber or customer, except the dialling or signalling information utilized in call or message processing.";
(b) Section 3121 of title 18, United States Code, is amended by redesignating subsection (c) as (d), and adding a new subsection (c) as follows:
"(c) Limitation. -- A government agency authorized to install and use a pen register under this chapter, or under state law, shall use technology reasonably available to it that restricts the recording or decoding of electronic or other impulses to the dialling and signalling information utilized in call processing."

SECTION 11. REPORTING OF INTERCEPTIONS ENCOUNTERING ELECTRONICALLY ENCRYPTED COMMUNICATIONS.
Section 2519(2) of title 18, United States Code, is amended by deleting everything after the semicolon in subparagraph (f) and inserting the following:
"(g)the number of interceptions encountering electronically encrypted communications, specifying the number of such interceptions that could not be decrypted; and
"(h)The information required by paragraphs (b) through (g) of this subsection with respect to orders or extensions obtained in a preceding calendar year."

Please take this thread to another newsgroup. If I had want to
read the whinings of clueless reactionaries, I'd have subscribed
to alt.fan.rush-limbaugh or some other such newsgroup instead
of rec.radio.shortwave.

Thank you.

454. AR1000 tuning knob flaky?

Newsgroup: rec.radio.scanner
Date: 1994-08-10 19:23:33 UTC
From: joe@avs.com
Message-ID: <32b9fl$8ti@nda.nda.com>
Source record: 270535

The AR1000XLT has a small knob on top that tunes up or down by the current freq. increment. I've noticed that sometimes when it "clicks" around the freq. does not change. Is this something others have noticed? It's almost like the switch motion "misses" sometimes (I assume the mechanical click causes a signal pulse somewhat like a computer mouse...).

Thanks, Joe

>police to remove the element of surprise and portray hobbyists as perverted
>voyeurs etc with no socially redeeming values.

In contrast with much of what has been (and probably will be)
written on this subject, this statement seems to me to have some
objective value, because it makes a factual prediction about
something that can be observed and verified by anyone. If it
turns out to be correct, the associated "disarm-the-public"
hypothesis will be supported, and if not the theory will need to
be revised. This strikes me as more useful than endless naive
wrangling over whether the conspiracy is perpetrated by
Democrats or Republicans or Liberals or Conservatives.

I would like to suggest a refinement of the prediction, though.
It seems to me that there's no reason for (let's call them)
anti-scanner interests to wait for the bill to fail before they
start this media campaign. Why not use it now, to drum up support
while the bill is being debated?

If think it would be wise for all of us to start keeping a close
eye on the media for an increase in stories of this type. If we
do start seeing more of them, it might also be instructive to do
a little investigating to find out exactly who they're coming
from.

I have already seen similar media stories about the Internet being
used to transmit "obscene" material and how the Internet needs
to be "regulated" to prevent such transmissions.

On last night's edition of Auto Week on public TV, the host warned about user-installed electronics interfering with the microprocessors which now control automobile engines. He said that improper installation could cause the engine to malfunction and used CB radio as an example of a potential problem. Is any one familiar with this type of interference? Was the host over-stating the case?

My guess is that they want to go after folks who clone their own phones, which doesn't seem to be illegal at this time; although, it may violate the small print of a service agreement. Cloning someone else's phone seems to be handled under the current laws.

I read Bills Scanner Mod Handbook Vol 1 last night (I wish I had read it before I wrote the guide) and esentially he gave the same recomendations I did. A discone on a 20ft mast on top of your roof is the best way to go for the average user. The range calculation is pretty much worthless in the real world. Terrain has a MUCH larger impact on your ability to receive a signal. You can make HUGE improvements in signal strength (10-20dB) by getting your antenna clear of obstructions. Above that height you will get only marginal improvements, relatively speaking. The reason is COMPROMISE, putting up a very tall mast on the roof can be expensive and dangerous (safety, wind loading, electrocution hazard, and mechanical stresses on the roof). I m not going to tell people that another 10ft of mast height will give them a significant improvement, in received signals, because it won t. While the field strength will be greater if your antenna is higher it will not be by large amounts, and there is a point of diminishing returns. You would be much better served using better coax and a better antenna.
You are welcome very much.

Good scannin' to ya.

Whistler makes a unit that has a radar detector detector detector
built in and Bel has one that you can sit in front of the radar
detector detector and it won't set it off. Also the radar
detector detector is called a VG2. See Car Audio and Electronics
august issue.

Bill
I had a similar experience when I put a CB in my Mitsubishi 3000GT. I
tapped into a spare fuse position to power the CB. Every time I keyed the
mic the factory installed burgler alarm went off, even though the alarm
wasn't armed. I ended up using 2 ferrite beads and an in-line power filter
before everything worked properly.
I didn't get as far as starting the car before I installed the filters, so
I don't know if there would have been any effect, but there could well have
been.

Good scannin' to ya.

Yes, but I imagine that the radar detector-detector-detector is still running
even when it shuts down the radar detector. This creates a whole new market!
Police everywhere will be needing radar detector-detector-detector-detectors.
Any entrepenuers out there?

Mike

471. ICOM R1 Warning

Newsgroup: rec.radio.scanner
Date: 1994-08-11 00:59:16 UTC
From: jim@ttech.com
Message-ID: <jim-100894165917@jimsmac.ttech.com>
Source record: 270601

The purpose of this post is an attempt to prevent someone from making the same bad mistake that I did. The ICOM R1 has recently been getting favorable reviews from alot of people on the newsgroup. I had one and was extremely disgusted with it for the following reasons:

1. EXTREME intermod.

2. EXTREME front end overload.

3. Cannot really scan. Constantly locks up on images.

4. Based upon performance, the R1 should cost less than $150. It is a rip-off at $500.

I contacted ICOM tech support and they told me that there is nothing they can do. "That is just the way the radio is." That is also just the way the radio was returned! I am an enginner in the computer industry, and if I designed a product that performed as poorly as the ICOM R1, I probably would be out of work.

Bottom line:

The ICOM R1 is a good radio as a small novelty toy (not a scanner!) only if you can pick one up for less than $150. ICOM should simply drop the radio and not introduct the "A" model. You get alot more bang for the buck with a $200 RS or Uniden scanner.

Good Scanning,

-Jim

An easy way to inhibit the Pro-43's power-saving mode: hit the `direct' key. Power-saving mode is invoked only when the scanner is in manual mode, not in direct search mode, even if the scanner isn't actually searching at the time.

I do this often when I want to sit on one frequency, but don't want to miss the first second or two of a transmission (while waiting for the radio to take another sample).

I agree with most of this posting. There is one tid bit that I can add
that has relevance. There was a mod offered by Raycom of England that
added a "roofing" filter (really a bandpass filter) to the 1st IF
of the R1. They sold this mod for a short period in 1991 and it dramatically
improved the performance of the R1 to these annoying problems.

Raycom was not an authorized Icom dealer at the time and later they
became an authorized dealer for the UK. When their status changed
to dealer, they discontinued offering this mod.

I sent my R1 over there in the summer of 91 and for about $120 it
magically re-appeared on my doorstep about 6weeks later with the
mode installed.

About four months ago I sold my R1 to a fellow at Lockheed ehre
in Silicon Valley. I wasn't using it much after I got my Yupiteru MVT7100.

I mention this because there are several persons on the net that have
had this mod performed and perhaps one of them has decided it is time
to part company with their modified R1.

If you can find one of these, you will find it lives up to most of what you
wanted in the R1.

> Big-business, that's why. It's when one big business out-lobbies another
> these days they get a biased law passed.

Did you read the text of the bill that was posted? Or just the stuff you quoted above?

To repeat, it says

> "(6) knowingly and with intent to defraud uses, produces, traffics in, has
> control or custody of, or possesses (i) a scanning receiver or (ii)
> hardware or software used for altering or modifying telecommunications
> instruments to obtain unauthorized access to telecommunications services."

...and so is obviously intended to do exactly that: Prevent the sales ("traffics in"), as well as use, etc., of such tools.

I'd also like to get a legal interpretation of the "grouping". It looks to me as though it says

> { (i) a scanning receiver or (ii) hardware or software }
> used for altering or modifying telecommunications
> instruments to obtain unauthorized access to telecommunications services."

in other words, scanning receivers are only subject to restriction here if they're "used for altering... to obtain unauthorized access to telecom. services."

And, no, "access to services" does not mean listening.

Hey, you want to really stir things up? Convince the NRA that scanners are a good thing, essential for home defense, etc.

(No, I'm not an NRA member.)

hi, i'm philip mulivor, a newspaper reporter in rochester, ny. once again i find myself writing about cellular telephone privacy (or lack thereof), and i need input from some serious, knowledgeable hobbyists on the following:

1. can people still buy new scanners that can be modified to receive cell phone frequencies? which units, if any, are easily modifiable and good performers?

2. where do scanner listeners obtain modification documentation?

3. what's the prevalent attitude among hobbyists with respect to cellular monitoring ?

thanks for your input. this group has helped me tremendously with past articles and i appreciate it.

> have used it against a myriad of things other than Mafia dons.

Funny you should bring this up. There are actually a myriad of laws that can be used to "hassle the unliked"; RICO is just one of them. This one has some potential for this, granted, but it's such a minor part of it that I don't see what you're so upset about. Why not spend the energy arguing for repeal, or at least revision, of the laws that *are* being abused in this way?

> Bottom line: if you possess a device that could be used to "knowingly

If they're that sufficiently out to get me, or you, or anyone else, the existence or non-existence of this bill is hardly

> This is a very ambiguous wording in this statute, just the kind of thing
> that prosecutors love to have in their arsenal.

Perhaps we learned English on different planets? It doesn't look at all
ambiguous to me. Notice especially the section title:

>>> SECTION 9. FRAUDULENT ALTERATION OF COMMERCIAL MOBILE RADIO
>>> INSTRUMENTS.

Owning a scanner that's sold across the counter at Radio Shack does not
constitute "fraudulent alteration", nor is it a "commercial mobile radio
instrument".

I also notice that this section of the bill is just a revision to existing law.
We'd need to see section 1029 of Title 18 to know what the real effect is.

> If you were to listen to the VHF marine operator, you would be
> "accessing telecommunications services".

Nonsense. To "access a service" means to use it, not observe someone else
using it.

> All it would take is for one person to decide to target you, and your
> ass is grass!

Again, that's true today.

> This must be stopped!

Try to acquire a sense of proportion. As "laws that restrict freedom" go,
this one is a drop in the bucket.

Richard Crisp you are a fruit cake trying to stir up hatred just
like Rush Limbaugh and Pat Robertson. Previous posts by others show the
intent of the law as proposed and I understand it is after those who
would seek technical info from the data stream to reprogram another
phone. This is obviously a crime as it intends to harm another.

If the existing government was so powerful and full of hatred to
its citizens it would have long ago destroyed Rush Limbaugh and Pat
Robertson for all the evil things they say about those who are charged
with governing the people. I see no effort on the existing governments
part to act against these folks so why would it single out little JOe Q.
Citzen for some special treatment? Only a werid paranoid person would
worry about something like this. Paranodia is a recognized mental illness
in medical circles. Get treatment soon for your own benefit.

Yes, I've noticed that too (mine isn't actually an AR1000XLT, but a Fairmate HP-2000, which is the same radio). Turning the knob should also stop searching or scanning, but sometimes you have to turn it more than once or twice to get it to stop. But it eventually works, and the knob has never given me any bigger trouble so far.

According to the AT&T owners manual, The security code changes
automaticly when the phone goes off hook. I think this would make
it diffult to crack the code!

Try Interactive Systems, Inc. the FCC authorized provider that updates nightly (703)812-8270 ......We have been using their data acess for years. They offer both dial up direct to Arlington, Va or a 1-800 access.

We dial up on the (703) line that they offer at 18.00 and hour (oops) that's $18.00 per hour.

Their services are w extensive to include SQL , Frequency "watch bdog" for those wanting to know if someone is appling for a license on a given frequency or sercvice.

Also site location, contour and area of operation maps available for the more serious user.

Sorry for the misspelled data. Using laptop in crowded environment.

Well, I am still getting familiar with my AR-8000. So far, it looks like
a winner!
Functionally, the unit is VERY VERY feature reach. As far as sensitiviy
goes, it
is not as sensitive as a Yupi. In some cases, I have found the Pro-43 a
little
more sensitive that the 8000. So, it ain't no Yupi-killer! The Yupi is
still the
king of sensitivity.

If that were the case, then we should demand that the law be extremely
narrowly worded to cover exactly what you described with no applicability
to anything else.

Unfortunately it is very ambiguously worded and could be made to apply
to many different acts.

The intent of the law is not what is important when it comes to a prosecution,
what matters is the WORD of the law.

Those that resort to personal attacks have shown us that they have nothing
of substance to say.

From: justin@sequent.com
Message-ID: <1994Aug11.154057.11399@sequent.com>
Source record: 270521

I was talking to my friend (RIGHT!) and he said he heard music being played on 928.937.5 mhz. What does this freq. mean? Why is it so high?? He said (RIGHT!!!) that he listened for a little while (like two songs) and they didn't play any station ID's... He says it was LIGHT music...(elevator music describes it best...) I don't know what in the hell it is, I would like to find out though. If you have ANY ideas please reply via post/email....

I thought that is may be a business on hold music (but WHY over the radio waves???)...

Thanks,
Justin

>
>does anyone else have this problem?

I do not have the problem, but it I have a suggestion. There is a section
in Bill Cheek's Scanner Mod. Handbook II about a high performance voltage
regulator in the PRO200x that could be the culpret. If it is going bad it
will use a lot more current from the battery, and you'll see it's life cycle
go way down.

Should be an easy fix if you have the book and the schematics.

>>

>You are right about the intent. The issue I raise is that due to the
>wording of the bill, it does far more than that.

After rereading the actual bill, it seems that they are also setting up the possibility that simply owning certain combinations of equipment may become illegal, i.e. possession implies intent -- Why would you own a scanner, soundblaster card and E-PROM burner unless you were planning to clone as cellphone? The burglar tools of the '90s :-(

It is also interesting that a 'scanning reciever' no longer needs to scan multiple frequencies to be a scanner. So much for the Opto Interceptor units.

In any event, I agree that this is something that needs a couple of letters; however, given that EFF, et al have come out in favor of this bill because of the limitations placed on wiretaps, etc. I don't know that there's much chance of killing it. And unfortunately, I suspect that the sections we have been discussing are too esoteric for my Congress Critters to understand; afterall, isn't fraud a bad thing :-(

If a radio that had an output of greater than 5 watts was installed in a pre-1993 Toyota Camry, keying the radio would fry the computer which cost $1200 to replace as this use of the radio was a warranty vilation.

My 1991 Ford Ranger slows down a couple of MPH when using the the cruise control and I keyup with 35 watts on 440 frequencies. Ford just warns about using more than 5 watts in the cab but no mention about externally mounted antennas.

There has been must discussion in rec.amateur.radio on the subject.

Jim Wayda (jim@ttech.com) wrote:
: The purpose of this post is an attempt to prevent someone from making the
: same bad mistake that I did. The ICOM R1 has recently been getting
: favorable reviews from alot of people on the newsgroup. I had one and was
: extremely disgusted with it for the following reasons:

: 1. EXTREME intermod.

: 2. EXTREME front end overload.

: 3. Cannot really scan. Constantly locks up on images.

: 4. Based upon performance, the R1 should cost less than $150. It is a
: rip-off at $500.

: I contacted ICOM tech support and they told me that there is nothing they
: can do. "That is just the way the radio is." That is also just the way the
: radio was returned! I am an enginner in the computer industry, and if I
: designed a product that performed as poorly as the ICOM R1, I probably
: would be out of work.

: Bottom line:

: The ICOM R1 is a good radio as a small novelty toy (not a scanner!) only if
: you can pick one up for less than $150. ICOM should simply drop the radio
: and not introduct the "A" model. You get alot more bang for the buck with a
: $200 RS or Uniden scanner.

: Good Scanning,

: -Jim

: jim@ttech.com

Jim,
I agree that the R1 is very susceptible to IMD and overload, because
ICOM had to cut corners with repect to front end filtering to get a wide
band radio in a small case. It is extremely sensitive, however. I've had
marginal problems with mine, nothing that an attenuator can't fix. It's a
nice radio if you're not in a high RF environment. I was able to listen
to the BBC on 5975 kHz with an attenuator and the RS scanner antenna in
a high RF region with good results (In Colorado).

The way I read the proposed law all computer modems would become illegal
too. These catchall laws are bogus from the getgo since the intent of
the law is vague so the courts have to decide what they mean. I agree
with Richard, this must be stopped.

At shortwave frequencies, height has a log to do with improving a
signal because of the wavelength but at VHF/UHF the results will be
minimal, once you are clear of obstructions.

Hmm, this sounds similar to a discussion of about two weeks ago. I'd be willing to bet that it's a commercial elavator music provider, such as Muzak. Customers pay for the use of a 900 mhz capable receiver, and Muzak plays rusty-butterknife music for them.

I really feel compelled to reply to this post, since I have been so satisfied with my R1 (And from the looks of other recent posts, there are many of us satisfied but perhaps silent, R1 owners "out there"), and hate to see it unfairly bashed.

Nothing in life is as marvelous as it probably *ought* to be, but I believe the ICOM R1 comes as close to that ideal as one can reasonably expect of a tiny, handheld, wideband receiver. The front end overload and intermod problems inherent in the R1 can be rendered relatively insignificant with the application of a little Scotch tape and a cut-off paper clip--hardly a high-tech solution, but then, I am no engineer. It seems to me that with a little creative thinking, the R1's problems can be reduced to the minor role they deserve so that the owner can fully appreciate the many advantages of this tiny radio (excellent sensitivity, wideband coverage, crisp audio, very small size, good variety of tuning increments and modes, better-than-average display light, convenient and sensible access to features and modes, etc.). In my opinion, the ICOM R1 is one of the top-of-the-line handheld receivers for the price, overall. I'm very pleased that I found one. But then I suppose that one always finds what they're *really* looking for.

>one familiar with this type of interference? Was the host over-
>stating the case?

Like most television programs, the facts may not technically be overstated, but they are presented in a way that makes you pay attention. RFI is a problem in newer cars. Computers don't just run the enignes anymore - they've been doing that for well over a decade. They also monitor the brakes, control ABS systems and airbags, operate climate control, etc.

Low power transmitters like CBs are not usually a problem. But how many CBers do you know that run more than legal limit of 4 watts? A lot of them are running 100 watts - plus. Amateur, commercial, and cellular equipment can all cause trouble.

Though some equipment is pretty cheesey, it is not usually poorly designed radio equipment, but an improper installation. To narrow down further, poor antenna system installation - such as improper cable for the type and/or power of the transmitter, weak grounding, bad location for the antenna, ect.

I have experienced two RFI problem on vehicles:

Using a UHF handheld ham radio in a rental car (Mercury Sable) caused the cruise control "coast" when transmitting. Unkey and the cruise control would resume. Getting the radio away from the dashboard solved the problem (I was using the rubber duck).

Using the same radio in another rental car (Honda Accord or Prelude - can't remember) caused the SRS light to blink intermitently when transmitting. Moved the antenna back about two feet and it stopped.

A friend of mine was using a "through glass" ham antenna on the rear glass of his Ford Explorer (don't remember which band). Each time he keyed the radio (I think he was using 30 to 50 watts) the rear window wiper would start running. He doesn't use the glass antenna any longer and I believe Ford replaced something in the wiper system.

Receivers are not always as passive as we think but I don't beleive that using a scanner in a car would cause any trouble at all. Anything in your car that is not shielded enough to protect it from these low levels of interference

would likely not operate correctly when the guy in the car next to you uses a transmitter.

>
>Question to radio professionals:
>How is it possible to detect a radar detector? As far as I know
>radar detector is a receiver, which detect certain (10-20+ GHz) frequency
>and gives alarm (to user). How is it possible to detect a detector and even
>more - to detect it from, say 100 meters distance?
>I'm not talking about jammers(which are transmitters), only about passive
>detectors.
>Anyone has ideas?

If you simply re-tune the oscillator in any cheap $29 radar detector, you can turn it into a detector-detector. It will also become a jammer (not really a jammer since it's not very powerful - may just a "popper"). It will only detect detectors that are pretty close (less than about 100 or 200 feet) but it will work.

A couple of other guys have answered your tech questions. I don't bother modifying my scanner to receive cellular phones not because it's illegal or boring. There's plenty of boring stuff in the legal bands. I believe in "Relative Right." That is, that no one's rights may supercedes anyone elses. In this case, I don't believe that my right to monitor the airwaves should violate anybody else's right to privacy on their cellular phone. There is a reasonable degree of privacy expected, after all. I don't see cellular eavesdropping as any different from wiretapping. After all, they all hook into the same system.

I am going to violate normal net etiquette by posting a letter I received in response to my suggestion that the journalist refrain from writing about cellular monitoring as it only adds gasoline to an already raging fire. His response to my request follows as does my rebuttal to his response. It may make for some amusing reading.

Yes, there is and thanks for asking.

You can leave the stories about assault weapons alone too, unless you provide balanced statistics showing the numbers of deaths caused by car accidents, cirrohis, smoking related problems, lightning strikes etc.

I have no problem with people writing stories about cellphone monitoring etc unless they have the all too common "yellow journalism" bent to them.

Bottom line with respect to cellphones is that the security issue will be solved by adoption of digital transmission and this will happen as a normal course of action. The thing that will drive this is the running out of frequency allocation of the analog systems. there is simply more traffic than the analog systems can accomodate

in the large metro areas. The newer equipment will be designed to handle digital transmissions which are more spectrally efficient and within 5 years it will be largely deployed throughout the US.

There will not be any easy way for the casual scanner listener to make any sense out of the digital transmissions, so the security will be enhanced, the capacity of the networks inreased and no new laws will be needed.

The point of the current laws is ludicrous anyway, as even old TV sets can tune cellular and it is a massive fraud on the consuming public for them to be pitched that due to laws in place that their comms are secure.

Again, not to be misunderstood, I have no problem with factual logical reporting that is not trying to sell an agenda for the politicians or that which is not trying to create hysteria by painting an unbalanced picture. The problem is that very little of this makes it to print these days especially when it comes to cellphones or guns.

If you would like to write a balanced story with no real agenda as described above, I will be happy to provide you assistance and have a number of years in this field both as a hobbyist and a professional electrical engineer.

I know where you're coming from, but you're looking at the bills wrong.
Consider these interpretations:

1) Because it's fraudulent, then this bill speaks about it (if you're not
fraudulent, then this bill has nothing to do with your activity).

2) ==Defining== what is fraudulent by including that in the title. In
other words, if you do anything we talk about, then we ascribe to
your activities the character of fraud.

I think 2. These bills are meant to pull in activities going on around
the country and speak on them, not to, with intent, alleviate activitiy
from being covered by the bill.

But you're missing the point. They are saying that *by having* an
Optoelectronics Interceptor you are showing criminal intent. At the
very least, you are guilty (or at least arrestable) until you show
a non-criminal reason to have it. Presumed guilt.

On the lighter side---

Picture this: The policeman says "let me see that" and it has "INTERCEPTOR"
emblazened across the front of it. "No sir" "That's for repair work on
my workbench at home." Yea right. At least put masking tape over the name!

How heartily I agree. You see, our forefathers were criminals. Do people understand that? Right to bear arms was not for sport, not for hunting, not for competition. That right was written to guarentee lethal effect on a government gone wild.

Rich, are you and I nuts? Are we wild and crazy mountain men, threatening the very fabric of society? Do other people not see these issues, these forecasts that slowly become reality? Or are most people distracted by the concerns of daily life (Darn, I forgot to fill up the truck on the way home from work)?

Cry the Beloved Country.

Richard,

I agree with the post above by Mr. Wayda, about the poor performance
of the R1, but having just bought one before the ban, I don't
think I will ever sell it. You bring up an interesting fix for it
though, if it is available perhaps from another company.

I would greatly appreciate if you could dig up the address of the
company in the UK that used to offer the IF filter, so that I may
write to them and ask if any other company has continued to offer
what they do not anymore. It's a shame it's not available from
them, because the R1 is just the right size that fits in the palm
of the hand so nice. I would be willing to install an IF filter
myself if I could get the part and an R1 service manual.

Thanks for any help in advance.

Email direct or post here.

>>
>>...and so is obviously intended to do exactly that: Prevent the sales
>>("traffics in"), as well as use, etc., of such tools.

Well, if we look at the elements of the 'crime', the first requisite
is that one must "knowingly" AND "with intent to DEFRAUD" commit the latter
parts of the paragraph. If one doesn't have BOTH of the mentioned elements
the rest of the enumerated acts become mute. Intent is one of the more
difficult elements for a prosecutor to prove, unless of course, one willingly
confesses their intent to defraud.
In summary, if you were to have one of the "prohibited" devices
but your intent was merely to possess, or experiment, or listen, or count
frequencies or anything other than to defraud someone, it would not be
a crime.
Any questions...?

The finances of America will break our back and usher in a "I don't care
what freedoms you take. Fix my life" attitude. It will happen within 8
years. I guess that puts us somewhere in the mid 90s on your scale.

Each of us has to choose where to draw the line in the sand, and stand and fight. I can understand why some are nervous about this bill, but my sense is that, for better or worse, this is *not* the place for pitched battle.

It has been said that this law is redundant. The same was said of the ECPA. But bill follows a trend.

The telecommunications act of 1934 made it illegal to *divulge* certain transmissions. The ECPA made it illegal to *listen* to certain communications, but did not outlaw existing equipment that was capable of receiving those transmissions. This new law would outlaw *possession* of the equipment if it was held *with intent to defraud*. So the proposed legislation is not redundant. It does tighten the noose around the hobby, but it is difficult to fight because, no matter what we may think its intent may be, the wording is unambiguous--"and with intent to defraud". I choose not to draw the line here, because however well-intentioned I might be, I would have to oppose legislation that, on its face, is out to prevent fraud by imposing restrictions that are not already in the law. I don't see how one can fight the bill without contributing to the false impression of an "outlaw" hobby.

Which is exactly why I am very disturbed when some newspaper guy gets on the newsgroup and asks us to talk about monitoring cellphones. Just what we need: some guy writing another "expose" on the bandits our there hacking or monitoring cellphones.

This is the sort of hysteria producing activity that encourages some congressslime to spearhead new further restrictive legislation.

When I first tried to by my R7100 just as thay were announced I couldn't find one anywhere. A conversation with the Icom reps at a local hamfest revealed the problem. It seems that a certain US agency orderd 10,000 of the radios. Icom allowed as how orders were backlogged a little because of that.

It really depends on what the prosecutors decide "DEFRAUD" and
"ACCESS" means. I believe you are being naive to take the position
that DEFRAUD only means those that make a practice of ripping off
ESN data and cloning phones. Again I cite the perversion of the
RICO laws to apply to things well beyond the "MAFIA" which was the
stated intent at the time of passage of the legislation.

Don't let your gaurd down by assuming the prosecutors are
"reasonable" by your definition and think the way you do. If you
do this, you may be making a very big mistake.

I will be posting a revision of the bill that is even worse than
what I have already posted.

558. Update: Newly revised "Scanner Ban" bill

Newsgroup: rec.radio.scanner
Date: 1994-08-12 12:55:12 UTC
From: crisp@netcom.com
Message-ID: <crispCuFAK0.3oo@netcom.com>
Source record: 270503
Cross-posted to: rec.radio.shortwave,rec.radio.scanner,alt.radio.scanner

attached is a newly revised version of the scanner bill which is even more restrictive than the last. Notice the definition of the term "Scanning Receiver". This goes well beyond what anyone famailiar with the hobby and equipment would consider to be a scanning receiver.

I am sorry to have to fill up this newsgroup with REALITY and proposed LEGISLATION, but this is the beauty of Internet: get the information out and in a timely fashion. This stuff is very serious, the penalties include $50,000 fines AND 15years in jail for violations. This stuff is the most blatant attempt yet on the legislative front to shut down our collective hobby and make us all criminals; all by legislative fiat.

This is very serious business and anyone that cares about their hobby and liberty should take this very seriously and be on the phone fax etc and let their congressman/senator know what you think of this.

For those of you that would rather see this discussion taken elsewhere I say: if you had a fire in your house while you had a party going on it would be a damn inconvenient time to have to deal with it. It would make a lot more sense to have the fire move to the woods where that sort of thing occurs all the time. But the reality is that there is a fire and it MUST be addressed. This same logic applies here. If you would like to be able to have a hobby to talk about in this very fun forum, take the time to read the following and take some action.

Don't rely on others to do your work for you, and don;t take the attitude that this doesn't matter, is only being raise by alarmists, and that it should be taken to some other group like alt.conspiracy This is real, it is now and it will affect you.

read it and weep!

SEC. 3. EFFECTIVE DATE.

(a) In General._Except as provided in paragraph (2), chapter 120 of title 18, United States Code, as added by section 1, shall take effect on the date of enactment of this Act.

****like IMMEDIATELY***

(b) Assistance Capability and Systems Security and Integrity Requirements._Sections 2602 and 2604 of title 18, United States Code, as added by section 1, shall take effect on the date that is 4 years after the date of enactment of this Act.

SEC. 5. CORDLESS TELEPHONES.

(a) Definitions._Section 2510 of title 18, United States Code, is amended_

(1) in paragraph (1) by striking but such term does not include'' and all that follows through base unit''; and

(2) in paragraph (12) by striking subparagraph (A) and redesignating subparagraphs (B), (C), and (D) as subparagraphs (A), (B), and (C), respectively.

(b) Penalty._Section 2511 of title 18, United States Code, is amended_

(1) in subsection (4)(b)(i) by inserting a cordless telephone communication that is transmitted between the cordless telephone handset and the base unit,'' after cellular telephone communication,''; and

(2) in subsection (4)(b)(ii) by inserting a cordless telephone communication that is transmitted between the cordless telephone handset and the base unit,'' after cellular telephone communication,''.

*****note that cordless telephone monitoring is now classified the same as cellular telephone monitoring******

SEC. 6. RADIO-BASED DATA COMMUNICATIONS.

Section 2510(16) of title 18, United States Code, is amended_

(1) by striking or'' at the end of subparagraph (D);

(2) by inserting or'' at the end of subparagraph (E); and

(3) by inserting after subparagraph (E) the following new subparagraph:

(F) an electronic communication;''

*****here is the aforementioned section 2510(16) as it reads in the current law******
***

(16) "readily accessible to the general public" means, with respect to a radio communication, that such communication is not--

(A) scrambled or encrypted;

(B) transmitted using modulation techniques whose essential parameters have been withheld from the public with the intention of preserving the privacy of such communication;

(C) carried on a subcarrier or other signal subsidiary to a radio transmission;

(D) transmitted over a communication system provided by a common carrier, unless the communication is a tone only paging system communication; or

(E) transmitted on frequencies allocated under part 25, subpart D, E, or F of part 74, or part 94 of the Rules of the Federal Communications Commission, unless, in the case of a communication transmitted on a frequency allocated under part 74 that is not exclusively allocated to broadcast auxiliary services, the communication is a two-way voice communication by radio;

********end of current law (included to emphasize the significance of the changes enabled by the new section 6 of the "the bill"****

********here is the definition of "electronic communication as it exists in the current law (title 18usc, section 2510 section 12)

(12) "electronic communication" means any transfer of signs, signals, writing, images, sounds, data, or intelligence of any nature transmitted in whole or in part by a wire, radio, electromagnetic, photoelectronic or photooptical system that affects interstate or foreign commerce, but does not include--

(A) the radio portion of a cordless telephone communication that is transmitted between the cordless telephone handset and the base unit;

(B) any wire or oral communication;

(C) any communication made through a tone-only paging device; or

(D) any communication from a tracking device (as defined in section 3117 of this title);

********end of definition in current law********

(note that now an "electronic communication" is not considered to be "readily accessible to the general public")

SEC. 7. PENALTIES FOR MONITORING RADIO COMMUNICATIONS THAT ARE TRANSMITTED USING MODULATION TECHNIQUES WITH NONPUBLIC PARAMETERS.

Section 2511(4)(b) of title 18, United States Code, is amended by striking or encrypted, then'' and inserting , encrypted, or transmitted using modulation techniques the essential parameters of which have been withheld from the public with the intention of preserving the privacy of such communication''.

*****here is that portion of the current law*******

(4)(a) Except as provided in paragraph (b) of this subsection or in subsection (5), whoever violates subsection (1) of this section shall be fined under this title or imprisoned not more than five years, or both.

(b) If the offense is a first offense under paragraph (a) of this subsection and is not for a tortious or illegal purpose or for purposes of direct or indirect commercial advantage or private commercial gain, and the wire or electronic communication with respect to which the offense under paragraph (a) is a radio communication that is not scrambled or encrypted, then--

**********end of current law****

SEC. 8. TECHNICAL CORRECTION.

Section 2511(2)(a)(i) of title 18, United States Code, is amended by striking used in the transmission of a wire communication'' and inserting used in the transmission of a wire or electronic communication''.

SEC. 9. FRAUDULENT ALTERATION OF COMMERCIAL MOBILE RADIO INSTRUMENTS.

(a) Offense._Section 1029(a) of title 18, United States Code, is amended_

(1) by striking or'' at the end of paragraph (3); and

(2) by inserting after paragraph (4) the following new paragraphs:

(5) knowingly and with intent to defraud uses, produces, traffics in, has control or custody of, or possesses a telecommunications instrument that has been modified or altered to obtain unauthorized use of telecommunications services; or

********here is the section with the "biggie"******

(6) knowingly and with intent to defraud uses, produces, traffics in, has control or custody of, or possesses_

(A) a scanning receiver; or
^^^^^^^^^^^^^^^^^^^^^^^^

(I realize that there those of you that believe that the defraud term clears all casual monitors, but notwithstanding, I point out the new wording of the bill)

(B) hardware or software used for altering or modifying telecommunications instruments to obtain unauthorized access to telecommunications services,''.

(b) Penalty._Section 1029(c)(2) of title 18, United States Code, is amended by striking (a)(1) or (a)(4)'' and inserting (a) (1), (4), (5), or (6)''.

(c) Definitions._Section 1029(e) of title 18, United States Code, is amended_

(1) in paragraph (1) by inserting electronic serial number, mobile identification number, personal identification number, or other telecommunications service, equipment, or instrument identifier,'' after account number,'';

(2) by striking and'' at the end of paragraph (5);

(3) by striking the period at the end of paragraph (6) and inserting ; and''; and

(4) by adding at the end the following new paragraph:

(7) the term `scanning receiver' means a device or apparatus that can be used to intercept a wire or electronic communication in violation of chapter 119.''.

******note the difinition of "scanning receiver" now includes a large number of test equipment including spectrum analyzers, any radio receivers, even an old TV that has 83 channel UHF capability******

-------soap box mode on-------

We must unite to stop this outrage. When you talk to your congressman ask them to explain to you what the need is for this, what the real intent is, why this is felt to be necessary etc. Be prepared to explain why this bill is likely to be controverted to prohibit acts that are harmless etc.

WE beat them yesterday on the Crime BIll, there may be some hope yet on this. But we must ACT and act decisively.

-------soap box mode off------

Thank you for you attention in this very important matter.

Does someone have a 'diff' file on these two radios? I know there has
been a lot of discussion about the merits of each, but since I cannot
afford to replace my aging/ailing BC200XLT :-(, I ignored them.

Now, one of my officemates has gone out and purchased a PRO-39 - with very
little prompting from me, BTW :-) Anyway, he is now wondering whether or
not he should return it in favor of a PRO-43 (or even a '51).
Unfortunately, I can't offer much help in his decision, as I know little
about either.

Can someone post a list of relative merits of both? Or point me to a file?

A major point I see many folks missing here is that 'precedents' are being set into law. This starts an avalanche of spin-off laws that restrict even further. Communication industry lobbyists and Congress went as far considering scanner bans based on similar restrictions in other third-world countries; is Congress ready to take this country to a new low? The day our legislators consider enacting third-world policies (Pres. Bush publicly commended Mexico on it's policies and law-enforcement) you can wave good-bye to democracy as we know it...

Andy

Repost from earlier:

There is an interesting test mode in the PRO-51 that, combined with the direct
search feature of the scanner, lets you pick up out-of-band frequencies. You
will have full access to the 66-88 Mhz ranges as well as the cellular base
range of 869-896 Mhz.

Actually, there are several test modes in the PRO-51 (most of these comments
should be true for any Uniden-made Radio Shack scanner, such as the PRO-46).
I'll describe them first and then how to take advantage of one of them to get
the restricted frequencies.

There are three data test modes. These modes completely destroy any frequencies
you had programmed into your scanner, so it's best to use these techniques
before you program your scanner. If you have already programmed it, you'll have
to decide if these new capabilities are worth reprogramming.

Test mode 0. Clear the scanner.
A well-known method of clearing the scanner to all zeros is to hold down the 2
key, the 9 key, and turn on the scanner. All frequencies will be lost.

TEST MODE 1. Fill channels 1-25 with test frequencies.

Press the 2 key, the 9 key, the L/Out key, and turn on the scanner.

This fills channels 1-25 with these frequencies:

1 30.050
2 40.840
3 49.900
4 138.150
5 162.400
6 173.225

7 406.875
8 453.250
9 511.9125
10 108.500
11 118.800
12 127.175
13 135.500
14 66.450*
15 76.825*
16 87.425*
17 157.800
18 482.3625
19 29.000
20 54.000
21 806.000
22 857.200
23 888.96*
24 911.500
25 954.9125

* indicates not within the PRO-51's normal coverage. More on how to use these
in a minute.

TEST MODE 2. Fill channels 1-17 with test frequencies.

Press 2, 9, Manual

Fills channels 1-17 with these frequencies:

30.00, 40.00, 50.00, 140.00, 155.00, 170.00, 410.00, 460.00, 510.00, 54.00,
109.00, 118.00, 127.00, 135.00, 810.00, 860.00, 950.00.

There is also a display diagnostic mode.

Display Test Mode.

Press 2, 9, Band or 2, 9, Moni.

This put the display in test mode. Every annunciator and every digit element is
turned on in a scan from the left side of the display to the right. To keep
this test mode continuous, release the buttons before the first scan finishes.
This mode does not affect stored memory. Press any key to exit this display
mode.

Now, if you've decided to try test mode 1, you will find several out-of-band
frequencies stored in your memory channels. Channels 14-16 hold

frequencies in
the blocked out 66-88 Mhz range, and channel 23 holds a frequency in the
blocked out cellular base range. Once you have these frequencies stored
in a
memory channel, the PRO-51's direct search feature will let you search
though
these ranges. In the cellular band, the scanner searches in the correct
30 Khz
steps.

You don't have to keep these frequencies in these channels. You can move
them
to any channel in the scanner. First move them to a monitor channel.

While on a channel with one of these frequencies, open squelch completely.
Press direct search button, either up or down. The direct search button
puts
the scanner into search mode and the open squelch holds the frequency.
Then
press the Monitor button. The frequency is now in the monitor channel
indicated
in the display.

Now you can move it to any regular memory channel in the scanner.

Enter the channel number
Press PROG
Press Monitor
Press the number of the monitor channel if the proper channel is not
displayed
Press E(nter)

The frequency is now permanently stored in the memory channel. You can do
a
direct search from this memory channel at any time.

The 66-88 Mhz range mainly covers TV audio. However, there is a strange
phenomenon concerning TV audio and the PRO-51. Channels 4, 5, and 6 audio
fall
within the 66-88 Mhz range, yet the PRO-51 will not pick up the audio
frequency
while searching in this range. However, TV channel 2 audio is at 59.75
Mhz.
When you add the intermediate frequency of 21.6 Mhz, you get an image of
the TV
channel 2 audio appearing at 81.35 Mhz. This does come in, although raspy,
since the PRO-51 is receiving in narrow FM mode while TV audio requires
wide
band FM mode for proper reception.

I'd be interested in anyone can verify that any of these test modes work
on the

PRO-46 or any other Uniden-made Radio Shack scanner.

The test modes I've described as modes 0 and 1 (clearing all channels and plugging in test freqs in the first 20 channels) have been around since the BC200XLT (I think also the BC100XLT). They also appear in the BC2500XLT, although I couldn't find any other test modes in that scanner. The BC220XLT allows you to do a display element test mode, but, unlike Jeff, I haven't confirmed any other modes as I don't want to wipe out all my channels. I expect that Uniden-made Radio Shack scanners will have at least these two modes and may have the other modes as well. I'm hoping a PRO-46 owner will test this for us.

I wish I could take the credit for coming up with this trick, although it's ironic that I had all of the relevant info in my head...I just didn't put it together.

The basis for this trick came from Glenn Cohen of Scanners Unlimited who was told this by someone who walked into his store. Glenn confirmed it with Larry Van Horn at Monitoring Times. I independently discovered modes 3 and 4, which, to my knowledge, have never been published before.

I did find the display test mode works on the BC220XLT but didn't want to lose all my memories to try the others. Thanks for biting the bullet and seeing what happens on yours! Of course, without the RS direct search feature, the test freqs in the Uniden-label scanners don't do much good.

563. PRO-44 Mods, Questions etc...

>

Again, it is difficult to oppose a bill that unequivocally prohibits something "with intent to defraud" without making it easy for others to paint any listening as an "outlaw" hobby. The problem is not with this bill but with the ECPA that prohibited listening to certain unencrypted through-the-air transmissions.

I would must rather have this bill and no ECPA than the ECPA without this bill. Perhaps, Crisp is right with his cataclysmic view of events. I would withhold my objections to this bill, as worded, but I would respond immediately to any legislation that seeks to deny us the right to simply listen to the spectrum.

If the hobby were organized, I would prefer we trade support for this legislation in exchange for relaxing the provisions of the ECPA that prohibit listening to the forbidden frequencies.

>I thought that is may be a business on hold music (but WHY over the
>radio waves???)...

Might be Muzak (or similar). We subscribe to it for MOH. We have an antenna on the roof of our PBX building that looks like it would run about 900MHz. I've never bothered to ask about the frequency since we don't maintain it. But they ID. A lot of radio stations will only ID once an hour (usually at the top of the hour).

Did you hear the music clearly or did it sound clipped off or broken?

I was hearing interference on my IC-R7000 in the office at 441.750. Sounded like adjacent channel interference but I could tell it was music. I had to switch to wide FM to hear it clearly and found the signal centered more around 441.805. Heard the broadcast ID of KFRC. I found the offending radio with the young lady at our front desk. Turned it off and the music on my receiver (and my two service monitors) went away. She now has a new radio - we are all happy. You could have someone close by with a "dirty" receiver.

Perhaps it was a cordless phone and the party was on hold - for a LONG time - maybe they were calling the DMV?

Just thought of something else... I remember seeing wireless stereo speaker systems advertised the brag about "NEW 900 MEGAHERTZ TECHNOLOGY". Maybe you have a neighbor that is using something like this. Compact Discs don't identify.

: Mike

Spread spectrum was not developed as an encryption scheme. The
properties that makes it desirable are :

Protection against jammers. This is measured in the AJ (anti-
jam) ratio. Some simple math shows how much more jammer
energy is needed to cause bit errors(digital communications)

Low probability of intercept. SS signals can be placed below the
noise floor in many cases. This means that covert operation
can be conducted with some communications.

Most people confuse the encryption with the last one. If the method
for spreading and the code is known, a little bit of work will show you the
signal. For more information I believe Sklar's "Digital Communications" has
a chapter on it. This was the text that was used when I took a class on this,
and it seemed pretty good.

Yes. :) A Technician class licensee can operate an all amateur
frequencies in the 6m and higher bands.

I'll leave equipment reccomendations to others, but the Alinco DJ-580
handheld seems quite popular among the hams here on campus. (And I
like my discontinued Yaesu FT-470 a lot too.)

BTW, any special reason why your message did not provide a username in
the header so I could reply by e-mail?

Mr. Crisp says:

>We beat them yesterday on the crime bill.

By using "we" and referring to the crime bill, which has absolutely nothing to do with scanning or the anti-monitoring legislation, Mr. Crisp is attempting to turn this group into a forum for his right wing views. There are a lot of Republican freedom-bashingl proposals I would love to bring into this discussion, but I do not do so because this is not the proper place to discuss such matters, there being plenty of other newgroups for that kind of discussion.

Strange as it might be seem, it IS possible to discuss these laws WITHOUT bringing party politics or extremist views into it. It is appropriate for Mr. Crisp and others to advocate writing to one's Congressperson to express one's displeasure. To use a very confusing piece of legislation as a means to attack a political party and bring in unrelated issues cheapens the argument and raises questions over one's motives.

I have always been impressed by Mr. Crisp's encyclopediac knowledge of radio and his patient willingness to answer questions and dispense valuable radio-related advice. His recent ad hominem attacks on people whose views he does not believe in, unfortunately, has damaged his credibility, in my opinion. opinion,

Jamie Hanrahan, Kernel Mode Systems came off saying that::
: In article <crispCuAuDB.7xt@netcom.com>, crisp@netcom.com (Richard Crisp) writes:

: > Since you are not an
: > active participant in the conversation, you are "unauthorized".
: > Since you "could" gain access to information that could be used
: > in a fraudulent act (such as getting a credit card number if someone
: > gives one out over the phone, for example), you could easily
: > be charged with "knowingly with intent to defraud access a telecommunications
: > service in an unauthorized manner".

: That's true today.

I just picked up this thread due to a toast host. From what I was able
to gleam it is a amendment to 18USC1029. I fail to see how a scanner
used in a NAM raiding scheem would fail to qualify as an "access device
making equipment" under 1029. I have a great amount of experiance with
this certian law as I believe that I hold the world record for defrauding
a long distance carrier (US$30,000,000~). In my case the "access device
making equipment" was a C=64 with a home brew telco interface. That
little '64 got me 6 years with a 5 tail back in '87. I'm sure that if I
had used a scanner and a computer to collect NAM's and ESN's it would
very much still be collection of access devices and as soon as I
collected over 15 of them the Secrect Service would once again be wanting
to talk to me (in fact a while ago in Seattle I was being hasseled
(questioned deeply) when someone else was doing this).

Just my 2 cents (US), I'll post better later when the coffe hits the
brain :)

The free usage of the terms 'possession' an 'or' lends flexibility to the
judicial system to interpret the new laws in future cases as seem fit
(or to fit the crime)...

The Crime Bill was beaten due to the realization that half our Congress
representatives would have to be imprisoned for their present behaviour...

The no-code license allows use of all amateur frequencies and modes above
50 Mhz. This includes the 6m, 2m, 220 Mhz, 440 Mhz, and higher bands.

> 220mhz, 440mhz 6m, etc..? Also, what brand(s) of handheld and desktop
> radios are the popular ones. I want something that is going to be reliable

Icom, Kenwood, Yaesu, and others. There are NO unreliable or badly made
radios on the market today, IMHO. There may be some that lack features
which you want, but they are all good.

> and have user friendly features. One more thing, I need recommendations on
> amateur radio and satellite magazines.

It depends on what you are interested in. QST, published by the ARRL, is
the standard reference. It has a good mix of construction articles, news
items, and FCC updates. 73 magazine has good construction articles and
wonderful ranting editorials by Wayne Green. CQ magazine is mostly of
interest to people who like contests and awards chasing.

>> search feature of the scanner, lets you pick up out-of-band frequencies.

>Note that the test feature will not work on newer PRO-51's.

Question: how can you tell the difference between an older PRO-51 vs.
the newer PRO-51? Did they append an "A" to the part number, like they
did to the PRO-2006 with the light on/off vs light dummer switch?
If I were interested in a purchase and wanted to know the difference,
would I have to fire up a new unit and actually go through the keystrokes
to find out?

Does anyone have proof that there are two different versions of the PRO-51
out there. It surprises me a bit, seeing how new this unit is.

Finally, does anyone know of any desirable enhancement of the newer unit
that the old one lacked?

Thanks in advance.

Some lady at Rat Shack told me that after implementing the standard mods on
the Pro-51, you can only direct access frequencies and can't scan them
or store them in banks. Is this true? Also, are the mods permanent, i.e.,
if you turn of the unit or take the batteries out, will they still remain?

Thanks,
Ken

Look in rec.radio.amateur.space. They post the NORAD 2-line list
weekly. They have info on getting list that are updated daily. I have
also gotten the list from NASA at spacelink.msfc.nasa.gov (192.149.89.61).
Till later, Si B.

Has anyone got any documentation (or anything!) on DVP or MDT (Motorola).
I'm of the opinion that DVP would be tough to decode; MDT may be as tough
as packet radio ....

Any thoughts ?

(Please don't POST to ask what DVP or MDT are, mail me if you must).

>scanner ban" here either.

The danger is in the *precedent* that has been set, to wit, that
any special interest group using part of the communications spectrum
can, with enough cash, get a ban passed that not only makes it illegal
for you to listen to "their" part of the spectrum, but banning equipment
as well.

Don't think it won't happen AGAIN. Their is a thing happening
now called the "spectrum auction" that will essentially offer up
chunks of spectrum use to the highest bidder....

The NRO (National Reconnaisance Office) isn't anything new.
It appears to have been around for quite some time, and serves/served as
a means for coordinating the use and information gathered by our
Intelligence assets. Primarily these are assets such as spysats,
spy planes, etc.

My belief (unsubstantiated) is that the NRO probably was created
(in secret) back in the days when the CIA and the USAF were bickering
about who should control aerial recon. programs.

If you want to get some history on this stuff, pick up a copy
of Burrow's book, "Deep Black". A very interesting treatise on the
subject.

Maybe - but the fact of the matter is that big food companies have
been lying to you (or at best, hiding the truth from you) for decades
about what goes into the foods you buy. The labelling law allows you
to make less obnoxious (and in some cases, safer) food choices in the
grocery stores and do so for the first time on the basis of something
that comes close to a consistant standard.

Sorry, but that isn't supported in all cases. While there are
cops who support gun bans and so forth, there are also an awful lot
of them who do NOT.

An awful lot of cops are aware of the statistics about how
many crimes are actually *prevented* by homwowners who ARE armed. I
don't have these statistics in front of me, but it is more than you might
think. Usually, these homwowners do not even have to discharge their
firearms, but merely clearly demonstrate their willingness to do so.
Most petty burglars value their lives more than their loot......

>A major point I see many folks missing here is that 'precedents' are being
>set into law. This starts an avalanche of spin-off laws that restrict

Which is exactly what has already happened relative to the present "cell capable scanner ban". For the first time in the history of the US it is now illegal to sell a radio receiver based on the frequency coverage it has. This is an important precedent.

By way of analogy, in 1986 the Federal laws were changed to make it illegal to manufacture machineguns for sale to the civilian population. What we are seeing now is that the Feds are trying to now make it illegal to manufacture/sell semiautomatic firearms for sale to civilians. The point whether you like guns or not is that once the precedent gets set of "its ok to ban a class of widgit based on its capabilities" it is therefore a simple extension of that philosophy to bring more items under the coverage of the ban. The 1986 machinegun ban was the first time in the history of the US that it became illegal to manufacture a particular class of firearm for sale to civilians.

Precedent is a very important feature of the legal system in the US. When laws are challenged or convictions are challenged, the appellate courts always look for precedent for guidance on how to rule. In the presence of precedent, they are obligated to rule in the same way given the same basic scenario.

A while back the ARRL took some heat in this forum because they had not "vigorously opposed" the scanner ban when they were asked. Unfortunately unconcerned about establishing a precedent that could be later used to justify additional restrictive legislation that could affect something they cared about, they simply chose to usurp their duty to come to the defense of their unorganized scanner bretheren. It would have been far better for them to have adopted a "Nato Policy" of "an attack on any radio hobbyist is an attack on all radio hobbyists" from my perspective.

I personally believe not doing so was extremely short sighted on their part part as the legislation I have been providing updates on recently may cause the ARRL members some grief. It is entirely feasible that the proposed bill may for example cause most RTTY decoders as we know them today to be banned since they may be used for intercepting "electronic communications" notwithstanding their uses in amateur communications. For example I know that Interpol uses SITOR (AMTOR) for sending sensitive traffic and often do so

in the clear.

If this comes to pass they will be mighty upset and may realize that
there was a reason to oppose the scanner ban of 92 because the
"bannit Genie" is now out of the bottle and he *really* likes his
freedom.....

Maybe I should explain my thinking a bit more on what to do.

If we can determine that the goal of this legislation is to simply prevent people from making illegally cloned cell phones which are used to commit theft of service, then we can point out that it is already illegal to steal service, and suggest that they can greatly narrow the scope of the bill to specifically cover "illegally copying the electronic identification numbers used for portable radio or telecommunications equipment and or using said illegally copied equipment to commit theft of service" and just leave it at that.

Or if the goal is to really restrict listening to communications then the tack changes to "why is this important". If the answer is to preserve the security of communications, then there should be a question asked "can you cite any instance in which life, property or liberty was compromised by someone listening to a communication"?

If the answer is no then maybe the following statement is appropriate "then without any hard evidence of harm being done to any parties, you find it necessary to introduce prior restraint to otherwise law abiding citizens"?

If people are concerned about the privacy of conversations nonetheless, then it seem highly appropriate to point out that two trends are already underway that will greatly rectify this situation and do so with no additional legislation:

1) digital cellular is being introduced in the large metro areas now
because the demand for channels has outstripped the capacity of the
frequency allocation to serve them. Digital cellular makes
far more efficient use of the spectrum as it timeshares
multiple conversations on the same channels. Digital cellular
will be adopted for economic reasons irrespective of the
privacy issue, but has the added benefit that it is fundamently
not monitorable with any scanner sold. The same gear deployed
in the large cities will eventually replace the entire infrastructure
and the problem is therefore self-solving relative to cellular.

2) regarding cordless handsets, many of the newer ones use
speech scrambling and or spread spectrum techniques to enhance
security. In addition many of them are being sold not for that
reason, but because they work better, have better range
and are simply newer. In time virtually all cordless phones
will use this technology irrespective of the privacy issue.

Personally I think the reasons outlined above are the ones
that are cited as to the need for this legislation, but the
real truth is that the Feds realize they have a HUGE problem
relative to cheap hard crypto and are trying to do everything
they can to slow its widespread deployment. By making the disorganized
scanner users "eat it", they can enhance the feeling of security of
those that feel a need for security and therefore retard the
adoption of cheap hard crypto. Of course you are unlikely
to get any of the "experts" that testify on behalf of the
government before the Senate and House committees to
admit this.....

Guilty as charged, Thanks for the constructive feedback.

I will rachet down the anger and concentrate on solutions.

Would anyone like to join a mailing list to discuss strategies and
options that we can employ to derail this very objectionable
bill?

If so, please email to me and if it is not overwhelming,
then let's see it that makes sense:

1) get the traffic out of the newsgroup (largely)
2) get on with a real strategy to do something about this

I think the warning flag has now been raised, so let's get on with the
war!

I had a good friend that was a scanner enthusiast. He also was a dispatcher for our local police and fire departments. We spent many an hour listening to police and fire calls. One day, he was discussing scanning with an officer and the officer hostilly said that all scanner owners were ambulence chasers and that all scanners should be banned. Tommy answered that "I am a taxpayer. I pay your salary. You work for me. I can listen to you any time I please." Well said.

Makes you wonder what the officer was scared of others hearing?

The new bill seems analogous to laws against weapons possession (I admit the analogy is not perfect and I do *not* want to start a thread on gun laws) even though the crimes committed with weapons are illegal in and of themselves. It gives the prosecutor extra charges to level that might be used as leverage in plea bargaining.

I agree wholeheartedly that the bill should be as specific in its intent as possible, but I think the goal is broader than stated here. The intent is to make *possession with intent to defraud* a crime. Outrageous example: suppose law enforcement authorities found a group who had used their equipment to illegally clone some large number of phones, but none of those phones had yet been used. Or suppose they discovered someone with equipment capable of impersonating cell phones, but the equipment was not in use at the time. What could they charge them with but "possession with intent to defraud"?

Saw an article in Pop Comm or similar magazine this
month that went into great detail on Sabers. There are three
different models each with it's own unique characteristics.
They seem to be highly advanced hanhelds which are operated
from a computer. One model has a remote key function so base
can key up a walkie in the field and monitor its surroundings.
Most federal law enforcement agencies are using them
because of their inter-agency communications abilities. Your
tax dollars hard at work!!!!!!!!

The company was Raycomm Communications, who no longer exist as such.

However I'd been told that ARE Communications in London did R-1 and R-100
mods at one time. They advertise in ShortWave Magazine from time to time.

This will clear your scanner . . .
With scanner off, press 2 9 L/O simultaneously and turn on unit while
keys are depressed.
A restricted frequency can be found in program memory 23.
Use directed search to start scanning with 30kHz steps.
Use monitor to capture a frequency in a monitor memory.
Use standard procedure to move monitor memory frequency to whatever
channel you desire.

(FWIW, I returned my 51. The overloading and intermod made it useless to
me in Boston.)

Are they still available: Only what's in inventory since April, 1994 can be sold. No new radios can be made or imported that will recognize the cellular frequencies. As of today, you can still go to Radio Shack and many of the discount electronics stores and buy modifiable radios. I've also heard stories that US Customs isn't to strict (don't care) if you bring in a radio from out of the country.

Where to find: Not only here and in alt.rec.scanner, but CompuServe has a forum dedicated to scanners and shortwave. There are documents stored in their "library" that offer very complete and detailed information. Also, several magazines like Monitering Times will publish various modifications.

Why do it: Because it's there and somebody tried to prevent the consumer from using it. Kinda like, Why hack computer programs or find ways to bypass password protections. One group locks the door so it's another groups responsibility to unlock it.

I was at Rat Shack this AM and they have a Pro 59 on sale for $199.00. Is this a good deal for this scanner? Are you happy with it?

Also, the salesperson told me to hurry up and buy it because you never know when the government will "come in and pull it off the shelves..." What gives here? Is this just a sales tactic? He told me that the government was in this week and pulled the 50 channel-bank of the Pro-59. Is he full of shit???

I think we can all agree it would be a good thing for telephone users to be able to have a reasonable degree of privacy. People have enjoyed such privacy on wired phones for some time.

Personally, I think it was just plain irresponsible for the cellular telephone providers to have installed non-encrypted or scrambled systems in the first place. They pulled a fast one, and then turn around and lobby congress to try to put a band-aid on their boo-boo by hassling people with receivers which can receive normal narrow-band FM, which was quite legal before the greedy phone companies got involved.

Folks, the cellular phone companies make money because _we_ allow them to have exclusive use of their frequency ranges. They get free use of one of our most valuable resources, and then play fast and loose with the privacy of phone users.

This should stop. The bill in question should _require_ all cellular and cordlesss telephone transmissions to be encrypted by early next century. Does anyone here believe the billion-dollar companies that are making a killing by exploiting the RF spectrum cannot afford to do this? Don't they owe the public something in return for our forfeiting the use of these frequencies?

With this approach, phone users get their privacy, and scanner users get their scanners. It would have to be illegal to build or use decoders to try to decrypt such transmissions, but there's already a great deal of precedent for that (satellite transmissions, for example).

As Rush, er, I mean, Richard has pointed out, digital cellular is on the way and spread spectrum cordless phones are already here. There is no technological excuse for the status quo.

: if you turn of the unit or take the batteries out, will they still remain?

Ken:

1. Standard frequencies can still be accessed normally. The cellular
frequencies can be stored in memory, by putting them into a monitor
memory and then moving them into a bank (see the manual).

2. So far as I can tell with my Pro-51, the mod remains until you
reset the unit again.

That's assuming a 'fair and just' legal system. Supposing you're pulled over and you have a myriad of scanning radios and amateur radio gear under the dash (not to mention the antennas on the car). What if you were detained because you were in an area known to harbor cell-phone pirates (at the exit of tunnels, bridges, etc). If the officals were not making their quota (yes, they have to show a quota of apprehensions to justify their existence) they could easily confiscate all your gear and YOU have to prove your innocence. You lose while at the same time you're helping to boost an official's career. Can't happen? Watch/read/listen to the news. Most of you have already seen thise kind of malpractice of justice in other criminal areas on programs such as 20/20, Nightline, etc. The pressure will be on the enforcing agencies to apprehend, regardless of cost...

I talked to the computer people at the Police Service when I worked there
about the MDT's in the Police cars. Short answer is it is propierty soft-
ware that MDI had written for the system. So to monitor this traffic you
would need a MDT, you would have to know the CADRE number (operator number)
and the password of the user. I could monitor the calls from my terminal
on the in-house system (DEC mainframe, running UNIX) by a keyboard command.
but I could not access info sent to a specific unit. As a records clerk
that function was locked out, but could be monitored by a Station Sgt, and
the Sysop. It would take quite a bit of hacking skill to be able to be
able to translate the info into something readable..

I'll agree that there is too much rightwingism in the US.
However, I'm not sure that more leftwingism will make it any better.
Then we will have religious bigots running our personal lives, and
socialists taking away the money we make.

The US was an experiment in freedom. Let's go back to that experiment.
This is the only country where we can even dream of real freedom
in both personal and financial realms. There are plenty of other
right and left wing states.

> and what reasons would those be?

Basically, the nearer the ground, the more the field is "grounded".

> I read Bills Scanner Mod Handbook Vol 1 last night (I wish I had read
> it before I wrote the guide) and esentially he gave the same recomendations
> I did. A discone on a 20ft mast on top of your roof is the best way to go
> for the average user.

I just re-read it and that's not what I got out of it. You're right that another 10 feet on top of 20 ft won't be a big improvement, but another 20 or 30 or feet probably would be.

The big compromise though is in coax losses. You do get less advantage with increased height the higher you already are, but coax losses are linear with distance, so eventually the coax losses catch up with the gains from height. Bill has a nice table for this.

You're right about wind loading and roof stresses.

The CHP, for example, who probably get more distance out of the VHF spectrum than most other users, put their antennas on VERY tall towers... but they have the bucks to use tri-beam towers, and very good coax.

But on second thought, as a practical matter you're probably right, in that a discone on a 20' mast over your roof will probably give you all the signals you could ever *want*. Heck, I'm in San Diego, in a townhouse where I can't put an antenna on the roof, so I'm just using a multiband vertical half-wave dipole in my attic (second story) and I can often hear the *LAPD* repeaters -- I'm listening to some right now. (that's about 100 miles away as the crow flies.) A discone 20' higher might give better reception on those signals, but it's not

as though I really need that, there's more than I can listen to locally...

> with Richard, this must be stopped.

"Vague" is just the opposite of what this law is -- to me it seems to be extremely specific.

Someone asked why we need this law when "theft of service" is already covered by other laws. The answer is that the folks doing the illegal modifications usually aren't the *users* of the modified phones -- they sell the mod'd phones to others. And prosecutors and juries are generally not very tech oriented, and some successful defenses have been mounted along the lines of "this guy was just fooling around with electronics, there's no reason to think they intended to steal service from anyone". This bill was written because prosecutors in L.A. and other places where cell theft is rampant have *asked* for it as a tool to fight this particular problem.

Yes, it has potential for abuse by prosecutors and police officers. So does nearly every other provision of the various city, state, and u.s. penal codes. So this alone is not sufficient reason to complain about this bill.

If I were going to write my congresscritter about this, what I might ask for is an explicit provision that this bill does not make simple hobby-type ownership, use, etc., of scanners illegal, even if they're in the same room with a computer, PROM burner, cellphone, etc. I fully expect that the response I'd get would be similar to: "but that's already stated in the text -- this bill only covers use of such equipment to modify cellphones and similar equipment with the intent of theft of service".

On the other hand, if you go screaming about your "right" to monitor any frequency you damn well please, even though the vast majority of the electorate would rather you not have that right (as they're far more likely to be cellphone users than scanner owners), you aren't very likely to get that friendly a response. To put it mildly.

From: g9153402@huey.csun.edu
Message-ID: <32jgms$4un@nic-nac.CSU.net>
Source record: 270444

Recently acquired the RS PRO-2030. I live in the San Fernando Valley (Northwest part of Los Angeles) and I have been receiving cellular calls on it in the lower part of the 896-956 Mhz spectrum. Does anyone have info on any Mods you can do to receive frequencies beyond the bands it allows, to receive the missing parts of the 800 mhz band, and other areas it isn't programmed to allow?

Thanks

636. Re: Wanted Pro-51 Mods

Message-ID: <32jk9d$rh0@bigfoot.wustl.edu>
Source record: 270458

I tried the POWER + 2,9,Lockout Mod (risking losing all my frequencies), and saw the "forbidden" frequency in bank one.

Now that I'm feeling a bit riskier, and would like to set up programmed limits (so the scanner automatically loops between 870 and 890).

Is there a more permanent (hardware) mod for the Pro-51 that allows direct entry of cellular freq's?

Thanks,
Chuck

Message-ID: <32jvu8$3so@nyx10.cs.du.edu>
Source record: 270450

I went into Radio Shack today and the pro-46 and pro-23 handheld scanners were being uplled from the shelves. The manager said that they were told to pull them since they could be modified(seems stupid to me, since almost all scanners can be modified(although the pro-23 can be modified with a code on the keypad)). And that they won't be allowed to sell them anymore. Radio Shack is probably pissed about this since the pro-23 is in their new catalog.
The pro-46 I don't know about. I heard/tried one mod(the "surgeon's mod") and it didn't work. So I don't know why they targeted that one, when almost all scanners can be modified. Anyone else know about this?

I believe that is a matter for the courts to decide. It can go either way.

>For sake of argument I'm going to do a turnaround and ask you to defend just
>why you feel you have an inalienable right to listen to cellphone calls. In

This isn't about cellphone listening. It is about common sense and avoidance of prior restraint on otherwise law abiding citizens.

It is illegal to listen to cellphone calls as we all know. Obviously that is an unworkable means for assuring security of those calls as we all know.

I maintain that natural market forces will solve the cellphone/cordless phone security problem with no new legislation necessary.

Cellphones are going digital to get better spectrum utilization. This will happen over the next few years.

Cordless phones are moving to 900mhz and many use spread spectrum technology which has gotten very cheap with advances in VLSI technology. They work better than teh 49mhz ones: have clearer reception and greater range. Not to mention the improved security.

All of the rest of the services should arguably be open game. If security is important, use scrambler technology. It is not that expensive.

I suspect the "real" reason for this legislation is to slow down the deployment rate of cheap hard crypto until the feds can get some sort of legal requirment to use only government approved encryption algorithms in crypto gear.

The cellphone and cordlss phone limitations provide a temporary relief mechanism and a lot of political bennies and at the same time make an excellent cover for the "real" reason for the legislation.

>extremely disgusted with it for the following reasons:

Jim,
I've run across this same message in a number of radio related
areas and feel obliged to, in some small regards, "set the record
straight".
I think the shortcomings of the R1 have been well documented by
now and are pretty widely circulated. You correctly describe a number
(perhaps not even all) of them. It is not, however, as you indicate an
unmitigated failure. I own one and use it regualrly in teh suburban
Seattle-Tacoma area. I have encountered some difficulties with this (and
other manufacturer's units) similar to those you describe. it is
certainly NOT the radio I would recommend for any new scannist to acquire
as his first radio nor would I feel comfortable suggesting that an
experienced hobbyist rely on it as his ONY radio.
It is not an unmitigated disaster and does have it's place and
uses. I am quitre sure it doesn't/didn't fit YOUR needs. It works well
for others. For those considering one, I urge caution but don't suggest
yo ignore it as a second handheld, military UHF receiver or some other
particular use. Comparing it with an MVT 7100 in the University District
near downtown Seattle, both the onwer of that radio and myself concluded
they were very comparabel, though not identical in performance. I've had
it suggested that a smaller rubber duck antenna (the Comet "Baby-Duck" was
recommended) does a WHOLE lot to reduce over load and intermod complaints.
It all boils down to careful shopping and knowing what you want
... along with realistic expectations. It didn't meet your needs, that is
regretable, but doesn't necessitate a net wide harangue. To each their own.

Bill,
RF can cause all sorts of nastly little things to happen. Most radio
installation manuals warn you to check your ABS braking system when used
in conjunction with your 2-way radio or cellular phone.

I can remember one time during the first year of my apprenticship I ran
the aerial cable past the Engin Management Computer. Every time you
transmitted the engine would die.

I've had similar problems with ignition sense power leads. When the windscreen wipers were turned on, the Cell Phone turned on and off. This problem did't show up for some months after the installation as we had had no rain.

All I can say is - Get Power Directly From The Battery.
Run All Cables As Far Away From The Cars Wiring As Possible

649. AR8000 Prroblems

Newsgroup: rec.radio.scanner
Date: 1994-08-14 07:12:20 UTC
From: ligosa@pipeline.com
Message-ID: <32kg4k$k3t@pipe1.pipeline.com>
Source record: 270457

Just got my AR8000 from JC. I luv it but seem to be having a few problems and I think I'm going to have to send it back for a replacement. I was told that Jonathan has a hassle free return policy. I sure hope so.

Here is what I'm experiencing:

Sometimes (alot) when I turn the unit on it dose'nt boot up, It just stays blank with the light on and a low squelch sound. Nothing in the dispaly and no response from the keypad. I have to take out and put back a battery to reset it.

Also on sometimes when I put the light on I got a loud flutter sound that drounded out the audio ? Unless there is something about battery consumption that I am confused about I would have to rule out low cells because the low battery message did not light up and also when I tuned into some strong TV signals and put on the light, it was fine so I don't know ?

Last but not least in only 2 days the BNC became VERY loose ?

DON"T GET ME WRONG I THINK THE AR8000 IS AWESOME..I just probably got a bogus unit. I'm sure JC will make good on it..

Any thoughts or advice, please post here..thanks all

Chris..

>whats it like... is it worth the price... im tempted.
>Tell us whatcha think.

Here are a few postings I had composed, in response to questions, just after getting the R10. I think this should answer most questions and put its performance/capabilities in perspective:

Message 77 Fri Dec 04, 1992
MSCHUSTER [Mike] at 19:50 EST

I promised to post some impressions of the Optoelectronics R10 FM Interceptor. Well, today I received one of the first units. It basically does what the ad says, but translating that to what the recreational monitor would want is another story.

First, it has a small speaker as well as a standard mini phone jack. If you plug in Walkman style stereo headphones you get sound in both ears ... right down to 50 Hz. The volume is adequate but not great.

The unit basically seems to sweep the range from 30-2000 MHz every 2 seconds. There is a "squelch" control which is really a very wide range RF gain control. When a signal exceeds the threshhold you set, the "lock" light comes on and the signal is demodulated. Meanwhile it keeps looking at the spectrum, so if a stronger signal comes by you instantly lose the previous one. If it locks on an unwated signal you can press a "skip" button on top and it starts sweeping again.

The telescopic antenna it comes with has too much gain and is too untuned to be of use in a high RF environment. In my office near Manhattan, it locked onto every TV audio, video, and FM station in the city. Interspersed were an occasional 2-way radio and lots of pagers.

In a car driving home, variations in signal strength make it dance from broadcast signal to the next, with snippets of 2-way radio in between. At home I tried various rubber duckies. The trick, basically, is to make the signals you're interested as strong as possible ... to overpower the broadcast stations. So far the duckie that came with my AR-1000 seems to do the best at removing FM and TV signals.

Right now in my apartment in Staten Island, the Interceptor is sitting next to me with that antenna. It's picking up a local car service, the paging

transmitters of a local hospital and repeater, and an occasional tx from the SIRT train crews.

So far I've yet to hear a cell phone .... even with a duckie cut for 900 MHz. This is, I think, why they sell a notch filter to remove everything BUT the 800 MHz band.

I'll be playing with this in various loctions over the next few days. In the meantime I'll be glad to entertain any questions.

The Interceptor is billed as a near field receiver, but really that means it locks onto any strong signal. I guess local broadcast stations have field strength from miles away like a 2-way radio at a hundred feet. Ditto with strong paging transmitters.

Steve: it NEEDS a "hold" button to complement its "skip" button. The only way it will remain on a frequency is if you make sure the one you want is the strongest signal it gets. This is a test instrument, not a scanner or receiver.

The broadcast services come through with FULL FIDELITY down to 50 Hz audio. Narrow band, wide band ... it doesn't care. It adjusts the bandwidth according to what it locks onto, and displays that on the vertical bar graph on the front.

Today I plan to stuff it in my pocket with a 2m rubber duckie (seems the best compromise) and go to some malls and fast food places to go hunting.

By the way, I've surt of surmised that it prefers TV broadcast audio to local FM stations since TV has broader deviation and thus more field strength. Also, curiously, the NYC NOAA weather broadcast kept cutting in while I was on the road with it.

I don't have a cordless phone, but there are some in my building and I don't hear them. According to the manual they should only be audible for a few feet due to low transmitter power. The car service and train crews i hear at home are less than a block away from me. Taking it on the subway today I heard the Manhattan transit police dispatcher, but no transit authority chatter. And yes, the local car service is simplex and so I was only hearing the dispatcher.

If you use an insensitive enough antenna and/or turn up the "squelch" the speaker is silent except for a small "pop" every 2 seconds as it sweeps. I'm not sure what generates that noise.

I've yet to hear a cell phone ... but I've yet to be next to one with the Interceptor in my pocket ... yet.

Am I impressed with "the radio"? It is =NOT= a radio. At least not in the traditional sense. But if you're nearby someone with a 2-way radio (walkie talkie, McDonald's cordless headset at the drive-in window, and probably cell phone) you can snoop in without knowing (or caring) what the frequency is.

The intrusion of broadcast signals is more than I bargained for. This, I suspect, is why they sell all those expensive antennas and preselectors. But with some ingenuity, in the right circumstances, you can work around that without spending an extra bundle.

I strongly doubt the government was targeting his little old Radio
Shack out of the 5000 in the U.S. The govt obviously knows they have
to go after the manufacturer. My feeling is, if a whole range of scanners
are now banned and pulled from the shelves, there might still be ways
to order them from underground suppliers, modifiers, or from out of the
country, however illegal...

Sad, but may be true. I haven't heard local law-enforcement (L.A. area)
ever cry about criminals and gangs having scanners to evade the law. They
probably have ways of incrypting data if they're into something super-
sensitive. And you don't see gangs roaming the streets while having to
be occupied with the buttons on a scanner to see if the police are after
them. That would just slow them down. If any sort of huge scanner ban
is ever enacted, you would probably hear huge screams from the media
(TV, radio, newspapers) who are big-time scanner users in finding and
reporting news stories.
But, then if the government tries to portray scanner users as perverted
voyagers, with no redeeming value, they would have to look at themselves
as the largest group of these oddies. I work in a govt medical center
myself, and you see radio, and some scanning devices around there, as
a recreational activity. Listening to a scanner, such as police calls,
can be very mentally benificial, for a patient otherwise locked-out
from the outside world. The facility I work at even has a quite well-
equipped ham radio station.
The scanner I just bought does scan part of the cellular ban. What I
hear there is quite worthless. You often only hear one-side of the
conversation, and are often cut-off as the cellular user moves to another
cell. Any cellular user (or for that matter, any telephone user) has
to be aware that their conversations are never guaranteed to be
100% confidential. The government is probably the biggest snooper out
there. Any statement by a cellular company to a customer that their
systems are secure, is nothing but a lie, and they know it, regardless
of how strong a scanning law is passed. The scanner police will have
to drag me from my house kicking and screaming, before I'll let them
take my little'old Radio Shack scanner.

Announcing... Version 2 of VK5CQ's "ScanBase"

Scanner Frequency Data Base System for IBM-PC

- Includes info taken from Official Gov't Data
(released July, 1994)

- Includes a true Data Base / Access Program for:

- Lookups by freq, industry-type, & licensee
- Display of freq's, modes, type & location
- Display of BOTH freq's for dual-freq services
- Entry of User's own notes on each Freq.Record

- Developed in FoxProLAN for IBM-PC (DOS-version)

SB-2-HF: ScanBase v2 with HF-Data (Astralia-wide)

SB-2-rU: ScanBase v2 w/ VHF/UHF data (region 'r')

SB-2-Qi: Update Frequency Data Files (t.b.ann'd)

SB-1-LC: ScanBase v1 on HP computer (included!)

Dealer inquiries encouraged. Prices & spec's sub-
ject to change without notice. For more info:

Write: Waite Research / Systems
GPO Box 222
Adelaide, SA 5001

David Myers (dem@skyline.dayton.oh.us) wrote:

: I think we can all agree it would be a good thing for telephone
: users to be able to have a reasonable degree of privacy. People have
: enjoyed such privacy on wired phones for some time.

BULLSH*T! (I thought you were going to suggest cellular users should
have the same degree of privacy, good thing that was NOT what you said
as they use an RF wireless device, they deserve NO privacy, or most
certainly no more than a PUBLIC pay phone in a very busy shopping
center!)

<activating emergency turbo-FLAME mode>

They deserve NO such privacy when they are using a device with an
antenna! If that were the case, the judges' would have ruled that
people using cordless phones have a reasonable expectation of privacy.
This is *NOT* what occured.

If you have an antenna attached, it is a RADIO, using PUBLIC
airwaves which MAY be monitored for ANY reason by ANYONE with
NO expectation of privacy, PERIOD.

If they want privacy, they can stop the car and use a PUBLIC
payphone. Ooops! Error. Public pay phone? I will re-state
that, they can use a residential phone with voice scrambling on
BOTH ends. Even a PUBLIC payphone no longer affords you that
right, since they did away with the doors and made them open-air.
It's utterly amazing what you hear when you are in an adjoining
payphone thumbing the directory like you are looking for something,
while in reality, you're listening with joy to the call next door,
on a wired line!

If it has an antenna, is it NOT PRIVATE.

Now, that all stated, what we need to do is lobby Congress to pass
regulations requiring:

[1] Cordless phones be clearly marked on the outside of the packaging
(in a manner similiar to software shrink wrap licenses) in a
reasonably large enough print the fact that as a RADIO DEVICE,
there is NO expectation of privacy and anyone may listen to your
conversation at any time.

[2] Telephone companies should be required by law to provide in their
"information pages" and monthly mailings of notices with the bill

the fact that a cordless phone does not afford any privacy to the person using and attaching the device to the phone system.

[3] Cellular providers should be required by law to make it clear in the contract that they are contracting a radio service which does not have any expectation of privacy -- except when using a digital system. They should make it clear that anything you say can be monitored by others due to the use of public airwaves.

[4] Cellular telephone advertisments should be required to carry similiar warnings as described above -- like some do for the mobile installation of scanners and radar detectors.

[5] Similiar notification as listed in item two for cellular billing statements. Possibly further stating the cellular carrier is not responsible for guaranteeing any privacy and no such guarantee is made.

[6] Similar warnings as found in item one for baby monitors (I have yet to hear one of them scrambled, and people will say literally ANYTHING in the "privacy" (??) of their own home!)

Well you see the general idea of what is needed. How do we get the congresscritters involved with doing something about the above? It is clear that a petition drive and high publicity might help. What we need to show is with or without scanner bans it makes no difference as you can not guarantee privacy in so much as one such scanner exists.

It has already been proven (CompuServe Ham-Net forum) that there is no problem bringing/importing cellular capable scanners into the country.

It would not make any difference anyhow due to the thousands of units already owned and being sold daily that are still "restorable".

We NEED legislation as I proposed above with the cellular-scan ban totally repealed due to providing and fostering the false concept that cellular (and/or cordless/baby monitors) phones are private, which as I have illustrated above are NOT!

If they made it a minimum fine of $250,000 and 50 years in jail, it would not make it any more "private"! They need to scrap this false concept the cellular industry has made and re-evaluate the situation and what their rules/legislation has done -- intentional and deliberate mis-informing the public regarding cellular phone privacy.

Now, how do we get our congresscritters to understand, the scanners are out there, nothing is going to stop importing by those wanting them and they are readily available and already in private ownership!

The fact they are already in private ownership MEANS NO PRIVACY can be expected, no matter what law they (try to) pass. I mean we will simply ignore it! How many of you keep to the speed limits when no-one is looking and the road is clear? (a show of hands please?), ok that is the number of people with scanners listening to cellular calls.

I would think the government is committing a criminal act of engaging in and fostering the mis-leading of the privacy of cellular communications by encouraging the cellular industry to spread such lies by passing legislation designed to cause them to suggest the calls are private because it is against the law to listen. That right there does NOTHING, ZERO, ZILGE to make it PRIVATE. It's as private as the public pay phones, and atleast they do not suggest any such right to privacy!

: Personally, I think it was just plain irresponsible for the
: cellular telephone providers to have installed non-encrypted or
: scrambled systems in the first place. They pulled a fast one, and
: then turn around and lobby congress to try to put a band-aid on their
: boo-boo by hassling people with receivers which can receive normal
: narrow-band FM, which was quite legal before the greedy phone
: companies got involved.

AMEN! AMEN! Agreed!

: Folks, the cellular phone companies make money because _we_ allow
: them to have exclusive use of their frequency ranges. They get free
: use of one of our most valuable resources, and then play fast and
: loose with the privacy of phone users.

So what's the suggestion/concept here? Re-allocating the cellular frequencies such that any trunked radio user can use them -- and in doing so - to permit testing of his/her system/equipment, the sale of scanners covering this range would be legal, right?

: This should stop. The bill in question should _require_ all
: cellular and cordlesss telephone transmissions to be encrypted by
: early next century. Does anyone here believe the billion-dollar
: companies that are making a killing by exploiting the RF spectrum
: cannot afford to do this? Don't they owe the public something in
: return for our forfeiting the use of these frequencies?

Yes, we need to FIGHT for OUR frequencies by spreading the TRUTH and exposing the LIES about the cellular phones and spread by the industry!

: With this approach, phone users get their privacy, and scanner
: users get their scanners. It would have to be illegal to build or use
: decoders to try to decrypt such transmissions, but there's already a
: great deal of precedent for that (satellite transmissions, for
: example).

Yes, and nothing will stop us from building our own, using part of a cellular phone wired to a scanner for example or importing such a device as the customs could care less about radio RECEIVERS. Such proof was illustrated recently on CompuServe. I suspect as an electronic apparatus, it would even interest them less!

: As Rush, er, I mean, Richard has pointed out, digital cellular is
: on the way and spread spectrum cordless phones are already here.
: There is no technological excuse for the status quo.

How true!

When my neighbor thought to waste $150 on a cordless with speech inversion scrambler from Radio Shack, little did they realize I had already purchased the needed decoder from Ramsey a few months earlier. Comes through crystal clear (through the decoder of course)!

The notice from Radio Shack to the retail stores was:
(courtesy of CIS HamNet)

URGENTURGENT**URGENT**
IMMEDIATE ACTION REQUIRED*

Due to an engineering defect, we are required by Federal regulation to cease selling or displaying the following two scanners:

20-305 PRO-46 HANDHELD SCANNER
20-504 PRO-23 HANDHELD SCANNER

IMMEDIATELY!! Remove these two scanners from display. Place them in a carton in your back room along with all store inventory. In the event you receive any additional shipments, place them in quarantine along with your display and current store stock. You will receive future shipping instructions for the return of these models for rework.

NOTE: THIS IS A FEDERAL REQUIREMENT. COMPLIANCE IS MANDATORY AND VIOLATIONS ARE SUBJECT TO SEVERE PENALTIES. ANY STORE FOUND IN NON-COMPLIANCE WILL BE SUBJECT TO DISCIPLINARY ACTION. POS WILL BE MONITORED DAILY TO ASSUE THAT ALL SALES OF THESE TWO SCANNER HAVE CEASED. THERE ARE NO EXCEPTIONS, INCLUDING LAY-AWAYS.

We have also stopped warehouse replenishment for two additional scanners:

20-148 PRO-2026 MOBILE SCANNER
20-308 PRO-51 HANDHELD SCANNER

Current information indicates these two models can continue to be sold. Continue to sell your supply of these two models unless notified otherwise.

If you have any questions, contact your District Sales Manager.

>excellent contidion, with manual.

i would *highly* recommend not buying this scanner. it was stolen from
Radio Shack (Mr. Rishaw lost his job after stealing this scanner and then
buying a warrantee for it). by the way, it was stolen from the Radio Shack
at Parmatown Mall. you can check on it if you want. i'd also recommend
someone calling up radio shack to tell them Jamie is trying to sell it.

I went to my local Radio Shack today, and he also told me he got a letter
from headquarters this past week to stop selling their PRO-2006 base
scanner, and return unsold inventory to Fort Worth,TX.
This all has to do with the cellular bands. Someone should write congress,
the president, the king, the cellular phone companies, the FCC, and everyone
else concerned, that was here first: Scanners and scanner enthusiasts,
or cellular telephones??? It isn't our fault that the cellular companies
designed such a cheap system, that anyone (in the past) with a few hundred
dollars could go out and scan almost all cellular conversations in their
area. The cellular companies has convinced congress to enact laws, which
may eventually prove unenforceable. Before cellular service, their was
mobile telephone service, and it was widely known that anyone could listen
in, even on some cheap shortwave radios. The cellular industry obviously
is in the forefront of taking away all our rights to the airwaves, and
have convinced the boneheads in congress that a terrible thing has been
going on, that phone calls are being heard nationwide. While it is true
that calls are being heard, anyone with half a brain should be able to
figure out that using a cellular phone, or any two-way transceiver, could
be received by any radio equipment in the area capable of tuning to
that frequency, and should be aware of this while talking on one of
these phones. Instead, the cellular industry tries to convince their
customers that their conversations are secure, by pushing through laws
like this which try to take away the tuning knobs on our radio receivers!
Thus, the cellular industry is trying to push this big lie to conceal their
incompetence. I hardly use a cellular phone myself. The reason, is the
rates (in Los Angeles) are absolutely onerous. They're not only trying
to rob us of our rights, they're also robbing us of our pocketbooks, with
huge rates. There's no competition where I live between the two cellular
providers. Both their rates are almost exactly the same. Has anyone
investigated them for price-fixing? They should be!

i would highly recommend not purchasing this item (or any item) from Mr.
Rishaw. while working at the Radio Shack at Parmatown Mall, he stole this
scanner and a ham radio. in addition, he has in the past sold stolen goods
through Usenet. he was caught when he purchased a warantee for the ham
radio. feel free to call Radio Shack to confirm. i'm also sure the Parma
police might be interested in what he's doing.

673. The EFF's Position on the Digital Telephony bill

Newsgroup: rec.radio.scanner
Date: 1994-08-14 23:50:33 UTC
From: dem@skyline.dayton.oh.us
Message-ID: <32mak9$8ki@skyline.dayton.oh.us>
Source record: 270334
Cross-posted to: rec.radio.shortwave,rec.radio.scanner

I am not an EFF member, nor am I endorsing the comments below. I just thought it an interesting addition to the discussions we've been having here, as it primarily discusses the non-scanner aspects of the bill which affect many more of us. This came from ftp.eff.org.

Leahy and Edwards introduce a narrow Digital Telephony bill
with major new privacy protections
==========

Today Senator Patrick Leahy (D-VT) and Representative Don Edwards (D-CA) introduced their version of Digital Telephony legislation. Since 1992, the Electronic Frontier Foundation has been successful at stopping a series of FBI Digital Telephony proposals, which would have forced communications companies to install wiretap capability into every communications medium. However, earlier this year, Senator Leahy and Rep. Edwards, who have helped to quash previous FBI proposals, concluded that the passage of such a bill was inevitable this year. To head off passage of the FBI's bill, Leahy and Edwards stepped in to draft a narrow bill, and asked for EFF's help in the process. EFF remains deeply troubled by the prospect of the federal government forcing communications networks to be made "wiretap ready," but we believe that the legislation introduced today is substantially less intrusive that the original FBI proposals.

Jerry Berman, EFF Policy Director said: "We have opposed digital telephony proposals for the past three years and still do not believe that such legislation is necessary."

"Thanks to the work of Senator Leahy and Rep. Edwards and Senator Biden, however, the bill contains a number of significant privacy advances, including enhanced protection for the detailed transactional information records generated by online information services, email systems, and the Internet," Berman said.

Many online communication and information systems create detailed records of users' communication activities as well as lists of the information that they have accessed. The new legal protection is critical in that it recognizes that this transactional information created by new digital communications systems is extremely sensitive and deserves a high degree of protection from casual law enforcement access which is currently possible without any independent judicial supervision. Under current law, the government can gain access to transactional records with a mere subpoena, which can be obtained without the intervention of a court. Under the new privacy protections in this bill, law enforcement would have to convince a court to issue an order based on a finding that there are

"specific and articulable facts" which prove that the information sought would be relevant to an ongoing criminal investigation.

"The fact that law enforcement has to take a case to court in order to get permission to access records is a major new privacy protection which will benefit all users of online communication systems," said Daniel Weitzner, EFF Deputy Policy Director.

Another important privacy protection is that there is a cap on the amount of money that can be spent on surveillance technology in the first four years. The Attorney General is authorized to spend up to $500 million on reimbursement telecommunications carriers who retrofit their systems so as to come into compliance with the bill. So that this cap truly functions as a privacy protection, we believe that carriers should only be responsible for complying with the bill if the Attorney General actually pays for modifications. Government should get what it pays for, and no more.

"Although we do not support the concept of digital telephony legislation, we believe that if Congress is to pass any version of the bill this year, it should be along the lines of the Leahy/Edwards version," said Berman.

"The version crafted by Senator Leahy and Rep. Edwards," Berman explained, "is substantially better from a privacy, technology policy, and civil liberties standpoint than the draconian measures offered in the past by the Bush Administration."

"As the bill works through the legislative process," Berman continued, "EFF will work to ensure that privacy and public process provisions are strengthened, and that the scope remains narrow -- continuing to exclude the Internet, electronic bulletin board systems, and online communications services such as America Online, Prodigy and Compuserve. Also, we note that the radio communication provisions have not yet been subject to public discussion, and hope that this will occur before the bill is considered by the full House and Senate."

EFF Analysis of and comments on major provisions of the bill
==========

A. Key new privacy protections

1. Expanded protection for transactional records sought by law enforcement

Senator Leahy and Rep. Edwards have agreed that law enforcement access to transactional records in online communication systems (everything from the

Internet to AOL to hobbyist BBSs) threatens privacy rights because the records are personally identifiable, because they reveal the content of people's communications, and because the compilation of such records makes it easy for law enforcement to create a detailed picture of people's lives online. Based on this recognition, the draft bill contains the following provisions:

i. Court order required for access to transactional records instead of mere subpoena

In order to gain access to transactional records, such as a list of to whom a subject sent email, which online discussion group one subscribes to, or which movies you request on a pay-per view channel, law enforcement will have to prove to a court, by the showing of "specific and articulable facts" that the records requested are relevant to an ongoing criminal investigation. This means that the government may not request volumes of transactional records merely to see what it can find through traffic analysis. Rather, law enforcement will have to prove to a court that it has reason to believe that it will find some specific information that is relevant to an ongoing criminal investigation in the records that it requests.

With these provisions, we have achieved for all online systems, a significantly greater level of protection than currently exists for telephone toll records. The lists of telephone calls that are kept by local and long distance phone companies are available to law enforcement without any judicial intervention at all. Law enforcement gains access to hundreds of thousands of such telephone records each year, without a warrant and without even notice to the citizens involved. Court order protection will make it much more difficult for law enforcement to go on "fishing expeditions" through online transactional records, hoping to find evidence of a crime by accident.

ii. Standard of proof much greater than for telephone toll records, but below that for content

The most important change that these new provisions offer, is that law enforcement will (a) have to convince a judge that there is reason to look at a particular set of records, and (b) have to expend the time and energy necessary to have a US Attorney or DA actually present a case before a court. However, the burden or proof to be met by the government in such a proceeding is lower than required for access to the content of a communication.

2. New protection for location-specific information available in cellular, PCS and other advanced networks

Much of the electronic surveillance conducted by law enforcement today involves gathering telephone dialing information through a device known as a pen register. Authority to attach pen registers is obtained merely by asserting that the information would be relevant to a criminal investigation. Courts have no authority to deny pen register requests.

This legislation offers significant new limits on the use of pen register data.

Under this bill, when law enforcement seeks pen register information from a carrier, the carrier is forbidden to deliver to law enforcement any information which would disclose the location or movement of the calling or called party. Cellular phone networks, PCS systems, and so-called "follow-me" services all store location information in their networks. This new limitation is a major safeguard which will prevent law enforcement from casually using mobile and intelligent communications services as nation-wide tracking systems.

i. New limitations on "pen register" authority

Law enforcement must use "technology reasonably available" to limit pen registers to the collection of calling number information only. Currently, law enforcement is able to capture not only the telephone number dialed, but also any other touch-tone digits dialed which reflect the user's interaction with an automated information service on the other end of the line, such as an automatic banking system or a voice-mail password.

3. Bill does not preclude use of encryption

Unlike previous Digital Telephony proposals, this bill places no obligation on telecommunication carriers to decipher encrypted messages, unless the carrier actually holds the key.

4. Automated remote monitoring precluded

Law enforcement is specifically precluded from having automated, remote surveillance capability. Any electronic surveillance must be initiated by an employee of the telecommunications carrier.

5. Privacy considerations essential to development of new technology

One of the requirements that telecommunications carriers must meet to be in compliance with the Act, is that the wiretap access methods adopted must protect the privacy and security of each user's communication. If this requirement is not met, anyone may petition the FCC to have the wiretap access service be modified so that network security is maintained. So, the technology used to conduct wiretaps cannot also jeopardize the security of the network as a whole. If network-wide security problems arise because of wiretapping standards, then the standards can be overturned.

B. Draconian provisions softened

In addition, the surveillance requirements imposed by the bill are not as far-reaching as the original FBI version. A number of procedural safeguards are added which seek to minimize the threatens to privacy, security, and innovation. Though the underlying premise of the Act is still cause for concern, these new limitations deserve attention:

1. Narrow Scope

The bill explicitly excludes Internet providers, email systems, BBSs, and other online services. Unlike the bills previously proposed by the FBI, this bill is limited to local and long distance telephone companies, cellular and PCS providers, and other common carriers.

2. Open process with public right of intervention

The public will have access to information about the implementation of the Act, including open access to all standards adopted in compliance with the Act, the details of how much wiretap capacity the government demands, and a detailed accounting of all federal money paid to carriers for modifications to their networks. Privacy groups, industry interests, and anyone else has a statutory right under this bill to challenge implementation steps taken by law enforcement if they threaten privacy or impede technology advancement.

3. Technical requirements standards developed by industry instead of the Attorney General

All surveillance requirements are to be implemented according to standards developed by industry groups. The government is specifically precluded from forcing any particular technical standard, and all requirements are qualified by notions of economic and technical reasonableness.

4. Right to deploy untappable services

Unlike the original FBI proposal, this bill recognizes that there may be services which are untappable, even with Herculean effort to accommodate surveillance needs. In provisions that still require some strengthening, the bill allows untappable services to be deployed if redesign is not economically or technically feasible.

C. Provisions that must be changed

EFF plans to work on the following issues in the bill as the legislative process continues:

1. Strengthened public process

In the first four years of the bill's implementation, most of the requests that law enforcement makes to carriers are required to be recorded in the public record. However, additional demands for compliance after that time are only required to be made by written notice to the carrier. All compliance requirements, whether initial requests or subsequent modification, must be recorded in the Federal Register after public hearings, to allow for public scrutiny.

2. Linkage of cost to compliance requirements -- the FBI gets what it pays for and no more

The bill authorizes, but does not appropriate, $500 million to be spent by the government in reimbursing telecommunications carriers for bringing their networks into compliance with the bill. The FBI maintains that this is enough money to cover all reasonable expenses. The industry, however,

has consistently maintained that the costs are five to ten times higher. Given the FBI's confidence in their cost estimate, we believe that telecommunications carriers should only be required to comply to the extent that they have been reimbursed. This spending cap is both a safeguard against requiring unnecessary surveillance technology, and a way to guarantee that carriers' expenses for electronic surveillance are truly paid for by the government, not by the customers.

3. Ensure right to deploy untappable services

The enforcement provisions of the bill suggest, but do not state explicitly, that services which are untappable may be deployed. The bill should be state directly that if it is technically and economically unreasonable to make a service tappable, then it may be deployed, without interference by a court.

4. Clarify definition of call identifying information

The definition of call identifying information in the bill is too broad. Whether intentionally or not, the term now covers network signaling information of networks which are beyond the scope of the bill. To maintain the narrow scope of the bill, this definition should be clarified.

5. Review of minimization requirements in view of commingled communications

The bill implicitly contemplates that law enforcement, in some cases, will intercept large bundles of communications, some of which are from subscribers who are not subject of wiretap orders. For example, when tapping a single individual whose calls are handled by a PBX, law enforcement may sweep in calls of other individuals as well. Currently the Supreme Court requires "minimization" procedures in all wiretaps, to minimize the intrusion on the privacy of conversations not covered by a court's wiretap order. We believe that the bill should reinforce the current minimization requirements by recognizing that stronger minimization procedures may be required.

This could be helpful in learning more about legislation which
affects our hobbies, and perhaps will allow us to contact legislators
themselves.

From: JPX@hr.house.gov
Newsgroups: comp.org.eff.talk
Subject: Congressional Committee takes to the Net (long)
Date: Fri, 12 Aug 1994 16:09:40 GMT
Organization: Committee on Science, Space & Technology
Lines: 130
Distribution: na
Message-ID: <JPX.16.2E4B9EC4@hr.house.gov>
NNTP-Posting-Host: 143.231.251.142
Summary: House Science Committee goes on-line
Keywords: Congress House Science Committee

This is the initial posting from the Committee on Science, Space,
and Technology of the U.S. House of Representatives, chaired by the
Honorable George Brown of California. We have agreed to serve as
the "beta" testers for House Committees trying to learn how to use
the Internet. We posted this message to some of the USENET
newsgroups that discuss topics relevant to our jurisdiction over
Federal civilian research and development activities to:

(1) Increase the number of people who know we do have
Internet access;
(2) Indicate how we can be reached on the net; and
(3) Start learning how to take advantage of this information
system in our daily activities.

Getting the Congress to use Internet has been discussed in a few
threads on various USENET newsgroups of late. Some of you may be
familiar with the E-Mail Pilot Project established by the Committee
on House Administration, chaired by the Honorable Charlie Rose of
North Carolina. Those Members of the House currently maintaining
an electronic mailbox for constituent communications may be found
by e-mailing "congress@hr.house.gov" with the text "HELP" or "INFO"
in the message body. You will receive an automated response with
the necessary instructions.

Also, the text of legislation introduced in the U.S. House of
Representatives during the current Congress is now available on a
W.A.I.S server located at the House Information Systems data
center. The server may be accessed from the directory at

quake.think.com or using the following information:

Server: diamond
Port: 210
Database Name: USHOUSE_house_bill_text_103rd

It can also be found on gopher.house.gov in:

Congressional Information/Legislative Resources

The database contains the text of House bills beginning with
October 1993 and is updated daily.

What follows now is the message you will automatically receive in
response to messages sent to housesst@hr.house.gov, the Committee's
Internet address. It describes items like the Committee's gopher
server, which you can also find at gopher.house.gov.

---------- begin ----------
Welcome to the electronic mailbox system for the Committee on
Science, Space, and Technology of the U.S. House of
Representatives. This Internet service is provided for ease of
communication with the Members and staff of the Committee.
If your message is addressed to a specific Member, it will be
printed out in hard copy and forwarded to the Member's office for
response by U.S. Mail.
If your message is addressed to a staff member of the
Committee, it will be forwarded electronically to that staff member
for response. Depending on the nature of the response, it might
reach you in either electronic or postal form.
Messages for the Committee press office will be acknowledged
electronically and then followed up on, if necessary, with material
by post or fax. You can reach the press office directly via
Internet at "sstpress@hr.house.gov".
The Committee also maintains a bulletin board on the House of
Representatives Internet gopher server at "gopher@hr.house.gov".
Much of the public information material provided by the Committee
is available on this gopher system.
Much of this information also is available on the Committee's
"Straight Talk" voice-response system. Dial 202/225-3018 and
follow the menu instructions for a touch-tone telephone.
Thank you for contacting the House Science Committee. Please
be patient as we experiment with this new way of better serving
your communications needs. If you wish to write to the Committee,
please direct your correspondence to:

Committee on Science, Space, and Technology
2320 Rayburn House Office Building
U.S. House of Representatives
Washington, DC 20515
---------- end ----------

At this time, we suggest you supply both your e-mail and postal addresses in any communication to the Committee. Each office in Congress has its own policy for responding to public inquiries. So, if we forward your e-mail to a particular Member's office, they may choose to respond with a regular letter. Our Committee hopes to increase our use of e-mail in responding to public inquiries.

We have chosen the following subset of USENET groups for our initial foray into the net.world:

alt.california
alt.cyberspace
alt.dcom.telecom
alt.politics.datahighway
comp.dcom.telecom
comp.org.cpsr.talk
comp.org.eff.talk

I don't agree that this would be the mood in the wake of an economic collapse. Check out the history of the depression, and the Bonus Marchers, and various other movements. We can very close to revolution back then, and yet the attitude was not "take my freedoms". It was more "you guys [politicians] screwed this up, and if you think we're going to go along with you any longer, you're crazy."

One thing at a time. Today it's owners of those evil-baby-killing-assault-weapons-which-can-kill-a-roomful-of-people-with-one-bullet-and-which-have-no-sporting-purpose. Yesterday (and probably again tomorrow) it was those perverts on computer networks (hello) who exchange pornography and allow child molesters to entice children. The day before it was the godless tobacco companies who sell death to little children and the helpless. Before that it was those awful (homosexuals/homophobes, pick one) and how they'd lead to the downfall of civilization. Before that it was those evil drug users who ought to be locked up for smoking a joint, unlike our fine upstanding alcoholics. Oh yeah, and somewhere in there it was "cult" members who owned rifles just in case the armies of evil ever came calling and needed to be fought (and lo, so it came to pass).

Your turn will come, just be patient. It's hard to whip up a good froth of public hysteria and outrage on more than one issue at a time.

Well, I had my local RS store try the national parts for a schematic for the Realistic SA-700 audio amplifier I picked up at a garage sale. Nat Parts said no go. Maybe there's someone out there with a copy. I'd love it!

Yikes! This is scary stuff. Newspaper Journalist! You are the reason that scanners may be banned. Funny thing ALL NEWSROOMS have scanners in them for getting their stories, but when average people own scanners we are electronic voyeurs... When the phone companies came up with cell phones they pushed them as safe and secure as land-line phones, oooppps sorry they are RADIOS folk sorry to surprise you but they are just radios... So the phone co. lobbists went to Congress and rammed through the ECPA forcing the manufacturers to retro-fit existing scanners. This act ECPA also forced TV sets to not have channels 73-83 on them anymore, because you could monitor cell phones on your TV set. When it became apparent BECAUSE OF THE MEDIA that the retro-fit mods could be defeated oppps better lobby Congress again to ban these horrible devices. The cell phone people still sell cell phones like they are as secure as the regular landline connections. Funny thing though it is the media that seems to publicize who they heard saying what to whom. Maybe Congress should take the scanners away from the media, because they seem to be the ones having gains from the use of scanners.

One possible use of Opto's Interceptor would be to use it to map out a city's cellular system. Go to each cell site turn on the Interceptor and scan for cell freqs. After gathering all the data one could determine what cell group each is in and accurately determine a callers direction of travel for example.

Just A Thought.

This reguards my Realistic Pro-34. Since I have replaced my rubber-ducky ant. w/ a metal center-load antenna I've been experiencing a problem. I scan around 150mhz and sometimes when a strong signal was being broadcasted I hear a buzzing noise that makes the freq. inaudible. It only happens when I turn my speaker up loud. I tried lowering the antenna all the way up and down and it still does it. Could it be that the magnet in the speaker is interfering with the circutry? Thanks in advance... ->

I do not know much about this new anti-scanner bill, but it would seem to me that all those cars out there that can scan/seek A.M. and F.M. stations would have to be removed? Is the ban on scanners or on certain bands like cellular? Is the AM/FM radio in your car considered a scanner? If not, why not?

Go back to the duckie.

The stronger signal from the telescopic antenna is probably allowing
intermodulation distortion to occur.

> Paul.

If you can do the mod, do it. I have the GRE converter for an old Uniden BC100XL and it works great! Only problem is the scanner has 12.5Khz steps, but the PLL in the scanner does a good job of locking close enough to the frequency. A little pricey but well worth it. Besides, if it ever blows out it has VHF/UHF mixer transistors that can be easily replaced, so this converter will be in use on many scanners for years...

Subject: ICOM R1 forsale
Organization: BFEC at GSFC, Greenbelt, MD

I have an extra ICOM R1 scanner for sale. Asking $275 for the unit.
I'm located by Baltimore, Maryland, so if you can't pick it up I'll split shipping with
you. Comes with charger and extra battery, but the extra battery is
on its way south(it holds only a small charge). Rubber Ducky included. I
have the manual but not the box. EMail me at this address

reider@atria.gsfc.nasa.gov

Sorry if I'm slow responding, I'm busy at work.

WH> Press Office.

FD> Yeah, can you tell me the title of Wendy Smith?

WH> Wendy Smith.

FD> Right.

WH> Hold on. This is April.

FD> Yes, I was calling to see I could get the title of Wendy Smith.

WH> Can I ask who I am talking to?

FD> I am Glen Roberts with the Full Disclosure News Service.

WH> And I'm just curious what are you look for her title for?

FD> I'd also like to get a phone number where I can reach her at.

WH> I'm not certain that Wendy generally talks to the press. I'm just
WH> curious what, for what reason you want to get in touch with her.

FD> I wanted to

WH> I can help you get in touch with her if you want me to.

FD> I wanted to talk to her about some phone calls from Air Force I.

WH> Ok, is there a reason you want to talk to her?

FD> Because

WH> It's odd, we don't usually get press requests for her, that's all.

FD> Ok, basically she was making phone calls from Air Force I today and
FD> they were being monitored by average citizens out there and we wanted
FD> to get her comments on, the use of radio telephones from Air Force
FD> One and the public listening in.

WH> Ok, and you're from Full Disclosure News Service?

FD> Right.

WH> Is that a publication?

FD> We have a magazine and a radio show.

WH> And, are you in Milwaukee?

FD> No, I am in the Chicago area.

WH> And you were listening to the call?

FD> I have information that she placed calls from Air Force I that were
FD> being monitored by the public.

WH> Like a ham radio or something?

FD> Like a police scanner, like something you buy at Radio Shack for $99

WH> Ok. Ok, and you want to talk to her about the substance of the call
WH> or you want to talk to her about the

FD> The publicness of the calls and whether she is aware the calls are
FD> monitorable by any of the 12 million people in the US with police
FD> scanners and things of that nature.

WH> Ok.

FD> Also, I was interested in what her title was because I just had a
FD> name and didn't know what her position was.

WH> Yeah. Um. What was your name?

FD> Glen Roberts

WH> And your phone number?

FD> (708) 838-4478

WH> Ok. Ok and what would you just. What was the conversation you
WH> overhead just for my information.

FD> My information is she placed a phone call or two from Air Force I
FD> that was broadcast for anyone who wanted to listen in on it.

WH> Ok, and you don't what the substance of the call was or who they to.

FD> I have some notes on that, but I would like to talk to her about it.

WH> Ok, well, I'm trying to help you out, but I am just. I'd like to know
WH> what I'm. What's she's gonna have to respond to before I you know get
WH> in touch with her. I'm sure she's interested.

FD> Well you can pass on it and she can call me back or not. Um, you
FD> know, but we like to talk to people and get their views on it and not
FD> have somebody telling people what to say.

WH> Ok, I'm not doing that at all.

FD> I don't want somebody to prepare a speech or a --

WH> No. No, I was not even insinuating that. I'm sure she would be
WH> interested in who she was talking to, when she talked to you. I was
WH> obviously a private phone call so, I don't want her to be totally
WH> caught off guard. You know what I mean?

FD> That's really the point of my call. It's it really a private phone
FD> call. Are the phones on that plane presented to the users of them as
FD> being private phone calls or are they being presented as being gee
FD> there are 12 million people with police scanners that can tune in.

WH> Right.

FD> Because additionally, New York Mayor Giuliani made calls from Air
FD> Force I today.

WH> Um hmm.

FD> I'm not sure if you can put me in contact with him or if I should go

WH> Yeah, if you want to talk to him, you should probably talk to his
WH> office.

FD> Right.

WH> Ok, well, I will do my best to get in touch with her. She's obviously
WH> on the road right now. Our communication to that site is somewhat
WH> limited, because of the, because the trip was obviously not planned. The
WH> decision to go wasn't finalized until last night. Our communication
WH> was not up to what it normally is for a trip.

FD> And your name is?

WH> My name is April.

FD> Can you give me the direct number there?

WH> Sure, it's 456-2580. Ok, if you don't hear from me, you can call
WH> back. But, I will try and get in touch with them. Like I said we
WH> don't have phones set up like we normally do on the road. But, I will
WH> do my best to reach them.

693. Advice Needed - Buying AR8000 in London

Newsgroup: rec.radio.scanner
Date: 1994-08-15 17:17:14 UTC
From: men0@ns1.CC.Lehigh.EDU
Message-ID: <32o7uq$2hbk@ns1.CC.Lehigh.EDU>
Source record: 270356

I'm considering asking my dad, who's going to London next month, to pick-up an AR8000 for me. Having never traveled overseas or bought anything there, I have several questions: Is there an retailer in London? If so what is their address? What is the likely selling price? How does duty work and how much will it be? He needs to state that this radio is for display, not use, correct? Finally, can I ask the retailer to change the cellular channel spacing to US spec? Any other US spec issues? Thanks, everyone, for your help!

Geez. If you get that kind of run around regarding publicly available
information, I'd hate to see what they'd do with information that
they hadn't already disclosed. Anyway, Wendy Smith is the
Deputy Director of Scheduling and Advance and Trip Director for the
President. She can be reached through the Office of Scheduling and
Advance at 202-456-7560.

: I was browsing thru a book on this the other day (idly, at the bookstore
: while looking for other stuff), and seem to recall reading that dsss is
: the easiest mode to sync to. I think you sort of slide your sequence back
: and forth over the signal, and when they're synced, the signal gets clear
: in an easily detectable way. (Can't remember the details of that, tho).

The same principle is used in the GPS constellation and some kinds of amateur packet modems to enhance the transmission reliability of small amounts of data in the presence of a large amount of random noise.

The base transmits a short pseudorandom sequence of bits. The receiver slides the same sequence along the uncorrelated background noise until the receiver notices that in one particular position their are far more matching "peaks" and "valleys" than in any other position. You are now in sync and can then copy the bursts that follow relatively easily.

Reputedly phones like the Tropez do not actually use spread-spectrum for the voice portion of the transmission, though, so we're still going to have to wait for Voice-PGP or something before we have true voice/data radio security.

: ...

A TALE OF TWO SCANNERS

~~~~~~
The Pro 39 and the Pro 43: A General Comparison
by John Quill Taylor

~~~~~~

This is a general yet practical comparison between two popular Realistic(TM) Brand portable scanners, the Pro 39 and the Pro 43. This is not an in-depth technical comparison, as these have been written already. This is a comparison from my own experience using both scanners. I've had a Pro 39 for seven months, and a Pro 43 was just acquired recently, so my report is probably biased toward the Pro 39, with which I am more familiar.

Overall Impressions and complaints:
==========

The Pro 39 & Pro 43 have some major differences and some subtle differences. The subtle differences can be surprising. For example, the beep confirmation tone is about one whole note higher in frequency on the Pro 39 than on the Pro 43! Also, each radio has its own "personal" behavior: the quality (or lack thereof) of its sound, the brightness (darkness?) of the internal lamp, and the ease with which you can read (or not read) the LCD display, all vary between one radio and another, even of the same model!

In MANUAL mode, both radios have a STANDBY feature that allows the scanner to consume less power, Both radios go into STANDBY mode after about 5 seconds. The STANDBY circuit produces and audible thump in an external speaker. When using an AC adapter (either charging or powering), an audible hum is heard when using an external speaker.

What's GOOD about BOTH the Pro 39 & the Pro 43:
==========

Both of these radios share the same small footprint (more like thumbprint!). They use the same battery pack (6 AAs), AC and DC adapters (9V), and have a similar look and feel, including the antenna connector (BNC), earphone connector (1/8"), and squelch and volume knobs. Both radios can be modified to restore full 800 MHz coverage, and modifications exist to eliminate the beep and improve the sound.

What's BAD about BOTH the Pro 39 & the Pro 43:
==========

Although a modification exists to defeat the beep confirmation tone, a switch to enable or disable it would have been nice. The sound of the beep when using headphones or an external speaker is quite obnoxious, but the beep is somewhat useful during programming, since the buttons are rather small.

The belt clip is a piece of trash. Granted, it only costs a dollar to replace (at Radio Shack); I've spent three dollars more than I care to have spent on this weakly designed part. Luckily, its failures have not caused any damage to the radio itself, a very real possibility.

The internal speaker's in both radios suck.

On my Pro 39, I once was removing the batteries while the power was on, and I lost all the frequencies! I am unsure whether this can happen to the Pro 43, but I recommend turning the power off before taking the battery pack out and leaving it off until the pack is securely in place.

When in PRIORITY mode, the scanners often "leap" from a frequency with a solid carrier. Also, during the "sampling" of the priority channel, the radio often "misses" a pressed button, requiring you to press it again. These little "bugs" occur also on the Pro 2006.

What's GOOD about the Pro 39:
==========

The Pro 39 has a lower price.

The Pro 39 has a much easier to read LCD, at least on the radios I have seen. I returned my first Pro 43 because the display was hardly readable.

The Pro 39 uses less than half the current drain as compared to the Pro 43 (according to published specifications). This was my initial reason for getting a Pro 39 versus a Pro 43. Where does all that power go in the Pro 43? Is it the triple conversion? Is it the triple conversion? Is it the triple conversion? Who knows?

While the internal speakers are awful in both models, my Pro 39 has a much better sound. It is, in a quiet room, even "listenable." The Pro 43 speaker "cracks up" (this may be the fault of the audio amplifier, since both radios perform well with headphones or an external speaker).

The general "behavior" of the Pro 39 seems a bit more "positive" to me, although I have owned this radio much longer than my Pro 43. When scanning, pressing LOCKOUT works immediately on the Pro 39, while it seems to hesitate a brief moment on my Pro 43.

What's GOOD about the Pro 43:
==========

The Pro 43 has a few extra front panel features that are nice, like an AM/FM button. The Pro 39 "assumes" AM mode in certain frequency ranges, and this

mode cannot be "overridden" with a button like the Pro 43.

The Pro 43 scans in both directions, from lower to higher channels (default "wakeup" mode, like the Pro 39) and also from higher to lower channels. This is a subtle but very handy feature that allows you simple way to "bounce" back and forth between two closely spaced "hot" frequencies.

The Pro 43 features triple conversion (versus double on the pro 39). I didn't think this was a big deal, especially if you live in a "little" town like I do, and I still don't think it's a big deal if all you do is scan the programmed channels. Where triple conversion pays off is during searches, but since neither radio has "frequency lockouts" during search mode, both radios will "hang" on dead carriers, birdies, etc. during searches.

The Pro 43 has a shorter antenna (about 1/2" shorter). It is also narrower (about 1/8" narrower).

The Pro 43 "remembers" the channels without batteries, although many times I have left my Pro 39 on all night (after the batteries expired) and the frequencies were still there. Maybe I am just lucky.

The Pro 43 has better frequency coverage (see the Radio Shack Catalog).

The Verdict:
==========

The Pro 39 is less expensive but it only uses double conversion. The Pro 43 uses triple conversion, and yet it uses more power, has a more difficult to read LCD, and sounds worse using the internal speaker. While some great discounts can be had on both of these radios, I strongly recommend holding and operating both radios side by side before buying, and, if I had to do it again, I would buy them in person, since it appears that each radio varies in its LCD display and sound quality.

My employer uses an 800mhz trunked system and on certain specific radios a 'phone patch. Since trying to monitor this, I have discovered that I can hear the phone calls on the "busness band" AND the cellular. Maybe I hear images on the cells, but the calls are ABSOLUTELY broadcast on the business band i.e. can also hear other customers on the trunk using 'phone. Are these considered "cellular" phones.....IMO They are simply "business band radio" and not subject to the ECPA. Comments?????

Please forgive me if this has already been asked, but I didn't see it on this news group. I've seen (like everyone else probably) the pro-51 on sale for what seems like pretty cheap. It didn't seem very hardy, but otherwise is it a good scanner? Is it worth the money at the current price or is something better avialable?

End of line...

Correct. It has some interesting RF properties which you touched on.
Taking a wider view (no pun intended), spread spectrum is just another
method of implementing the physical layer. If you want security,
encrypt the digital data prior to sending it to to the DSSS
"pseudo noise" "mixer".

tmnichol@nps.navy.mil (Troy M. Nichols) writes:
: I do not know much about this new anti-scanner bill, but it would
: seem to me that all those cars out there that can scan/seek A.M.
: and F.M. stations would have to be removed? Is the ban on
: scanners or on certain bands like cellular? Is the AM/FM radio

Ban is on importation and manufacture of scanning receivers that
can receive or be modified to receive cellular phone transmissions.
A scanner is defined as any radio receiver that can scan 4 or more
pre-defined frequencies. It is still OK for retailers to SELL
cellular-capable scanners that were mfg. or imported BEFORE April 26,
1994 (so they can sell their inventory of pre-April 26 units).
The reason RS is yanking units off the shelf in a sweaty panic
is because they were mfg. AFTER 4/26/94, are cellular-modifiable
(due to a design flaw), and thus in violation of FCC rules. OOPS!

: in your car considered a scanner? If not, why not?

Your car radio is considered a seeker, not a scanner. It seeks and plays
the next strongest station. When set to SCAN, it seeks and waits
10 seconds, then goes to the next station, waits 10 sec, etc, etc, etc.
In this case, it is "scanning" discrete frequencies sequentially,
but they are not predefined as programmed frequencies, even though
you have some number of presets (probably more than 4)i
for your favorite stations. Plus, of course, your car radio does
not pick up cellular, so you are safe there.

Although it can memorize stations in presets, your AM/FM radio is
still not a scanner strictly because it cannot scan those presets
automatically, even though they are predefined.

I suppose you could get around the scanner definition by coming
up with a scanner-less (i.e., no memories) radio that simply sweeps
the cellular frequencies (like your car radio searching for the
next strongest station), but then you are dealing with a device
that intercepts and demodulates cellular transmissions, therefore
still in violation of FCC rules.

>FD> Are the phones on that plane presented to the users of them as
>FD> being private phone calls or are they being presented as being gee
>FD> there are 12 million people with police scanners that can tune in.

It seems to me that increased awareness of the lack of privacy will alter the nature of future conversations, making them less interesting to those of the 12 million who monitor them. When Disclosure is Full, privacy will be strengthened. The last vestiges of the Golden Age of scanning conversations will rest in the large installed base of cordless telephones, after cellular calls become thoroughly digitally encrypted, and in electronic bugs, surreptitously placed, and in baby monitors, mindlessly left on around the clock. Yet, finally, with the assistance of the Nightly News, and sustained and multiplied efforts after the model of this conversation with the White House, boldly and forthrightly made, even these means will be rooted out, and the privacy that the electronically aware currently are able to provide for themselves will be more widely extended to those not in the know.

Yet, who will be the first to call his cordless neighbors to ask the kinds of questions that Glen Roberts had the courage to ask the White House? What kind of stout character is required to end even the possibility of interception? Or am I wrong about awareness curtailing conversation? After all, _friends_ and _family_ I have told continue to speak in the 46.61 to 46.97 Mhz range.

I am sure that there is money to be made in the demise of the Golden Age of scanning. Isn't Tom Kneitel an example?

I am afraid that if it were up to me, such calls to the White House would not be made, if only to slow down the end of an interesting era in scanning history. And yet, privacy will be strengthened; privacy will be strengthened, as the disclosure of what can be done with a scanner becomes more and more full in the brave new world of reasonably justified court-ordered decryption.

Great! Maybe they'll outlaw this now as they've done in the Telecom
bill with cordless telephone monitoring. What's the point of this? Alerting
the public of privacy issues is one thing. Alerting the government will
only cause scanner uses of this type to be made illegal. First your
SSN database and now this! Always trying to stir up some shit, aren't
you Glen?

The run-around is standard operating procedure at all levels of government for your basic low-level clerk types. They risk next to nothing by not giving out information, but they risk their jobs (or worse) if they give out information they shouldn't.

In practice, of course, this means that even information which any normal citizen expects to be publically available may need to be chased down without official "help". For instance, a few years back my father did an analysis of the budget growth trends in Santa Clara County, CA. In several instances, County office clerk-types responded to his inquiries about where past-year budget data could be found by first saying "I'm not sure that information can be made public, sir."

It's a cover-your-ass reflex.

Here's the text of a fax I received during Full Disclosure Live last night:

08/15/94 1:45AM

Thanks, I just got the fax number, I regularly listen to your stn on 5.810 mhz, it is indeed a very good stn and well worth the air time so please keep up the excellent transmissions.

A couple of points that I would like to make about the privacy rights. Here in well not just in Northern Ireland but within the whole of the U.K. we are restricted so much here for example it is illegal to listen to police, army, fire or even commercial aircraft, let alone to say that they use certain frequencies to transmit on. SO we do not even have the right to listen to the radio unless we do it their way!!

Here in N. Ireland much to the amazement of many we are subject to "Big Brother." Yes if you leave the country you can guarantee it is logged in the system! Maybe you could not care what happens in the rest of the world, the point I am making is that you don't have to live in third world countries to be subject to suppression, from the power of government control.

Anyway keep up the good quality on your station I for one will continue to listenn at around this time (1:00am for about 2hr).

(Note, all following comments by me are quibbling over definitions, more in the sense of curiousity and fun than anything else.)

So what? The freqs it scans are certainly "predefined" -- by the manufacturer. ie on the FM band, mine starts at 88.1 MHz and advances in 200 kHz steps to 107.9. Sure sounds "predefined" to me (at least, I don't think I can change it!). And as for "programmed", stuff that's "prgrammed" in ROM is still programmed.

> even though
> you have some number of presets (probably more than 4)i
> for your favorite stations.

> Plus, of course, your car radio does
> not pick up cellular, so you are safe there.

yes, so all of this is moot re the cellular laws.

> Although it can memorize stations in presets, your AM/FM radio is
> still not a scanner strictly because it cannot scan those presets
> automatically, even though they are predefined.

It is (almost :-) never safe to say that "no product of type X can do function Y". Lots of car head units can most certainly scan their presets automatically. The feature is often called "preset scan" or "memory scan". Mine has it.

(Remember, "no generalization is true, not even this one." :-)

> I suppose you could get around the scanner definition by coming
> up with a scanner-less (i.e., no memories) radio that simply sweeps

Again, the car radio does not "sweep", it steps in 200 kHz (FM) or 10 kHz
(AM) steps.

The Optoelectronics Interceptor, by contrast, is apparently a true "sweeper".
Has its manufacture been banned under the ECPA?

>Will it be modifiable to get the full 800MHz range?

Yes, the new RS 1000-channel base unit will have part of the 800MHz band
disabled; and will NOT be modifiable to get full coverage. The PRO-2006
covers the same frequency range (up to 1.3GHz) with 400 channels, but
can be modified for much more than that (i.e. 6400+ channels!!).

>I'm also very interested in the computer control unit available for the 2006.
>If the new unit doesn't support this, it will sway my decision against it.

Yes, the 2006 can be modified for computer control. Either the CE-232
interface from Commtronics (Bill Cheek) or the Opto-456 from Opto-tronics
(or something like that).

>I also suspect I should wander away from RadioShack and get an AOR or
>something. Anyone have any reccomendations for one of these?

>And finally, can someone hook me up with one of those mail-order places that
>sell the 2006 at a discount?

I would still suggest buying the 2006. I just did!!! Bought mine from
Marymac for $359 (+tax for us TX residents) delivered. Received it in 2
business days after placing the order, completed the 800 MHz & 15%
scan speed increase mods in about 60 seconds, and began enjoying my new
scanner. Marymac's phone number is (800)231-3680.

Danny

Ditto. Glen Roberts not only did a childish and stupid thing by
calling the White House ("nyaa nyaa, I heard AF1"), he seems to have
compounded it by seemingly trying to brag about it on the net. He and
his Journal just lot a lot of my respect. What a fool.

718. RADIO SHACK SCANNER BAN

Newsgroup: rec.radio.scanner
Date: 1994-08-16 22:30:04 UTC
From: jim@ttech.com
Message-ID: <jim-160894143004@jimsmac.ttech.com>
Source record: 270276

It is very possible that rec.radio.scanner or alt.radio.scanner are the cause of the following ban. Thousands of people read the postings regarding cellular modifications. I am sure these newsgroups are also read by the FCC. Therefore, we could be the cause of extinction of these products. I don't like to say "I TOLD YOU SO!", however I did post the following recommendations about 5 weeks ago:

1. Do not ask for illegal modifications on the newsgroup.

2. Ask only for "modifications". Don't ask for cell mods, cell frequencies, etc on the newsgroup.

3. Obtain all modifications via E-Mail. This is the discreet way of obtaining the information you
need.

4. Do not post illegal modifications for the FCC's viewing pleasure.

-Jim

jim@ttech.com

The notice from Radio Shack to the retail stores was:
(courtesy of CIS HamNet)

URGENTURGENT**URGENT**
IMMEDIATE ACTION REQUIRED*

Due to an engineering defect, we are required by Federal regulation to cease
selling or displaying the following two scanners:

20-305 PRO-46 HANDHELD SCANNER
20-504 PRO-23 HANDHELD SCANNER

IMMEDIATELY!! Remove these two scanners from display. Place them in a carton in your back room along with all store inventory. In the event you receive any additional shipments, place them in quarantine along with your display and current store stock. You will receive future shipping instructions for the return of these models for rework.

NOTE: THIS IS A FEDERAL REQUIREMENT. COMPLIANCE IS MANDATORY AND VIOLATIONS ARE SUBJECT TO SEVERE PENALTIES. ANY STORE FOUND IN NON-COMPLIANCE WILL BE SUBJECT TO DISCIPLINARY ACTION. POS WILL BE MONITORED DAILY TO ASSUE THAT ALL SALES OF THESE TWO SCANNER HAVE CEASED. THERE ARE NO EXCEPTIONS, INCLUDING LAY-AWAYS.

We have also stopped warehouse replenishment for two additional scanners:

20-148 PRO-2026 MOBILE SCANNER
20-308 PRO-51 HANDHELD SCANNER

Current information indicates these two models can continue to be sold.
Continue to sell your supply of these two models unless notified otherwise.

If you have any questions, contact your District Sales Manager.

Just like with the FBI Digital Wiretap legislation, they are stuck someplace in the 1950s or so. I would say the communication gear they are using is pretty poor.

Anyways, check out 415.700mhz narrowband FM (it comes in well on my under $100 radio shack scanner... yes, I have better scanners and it comes in just as well on them).

I haven't heard Clinton, but last night they were up on Air Force II out of Chicago coming in nicely.

in 1986, I recorded a number of phone calls placed by then President Ronald Reagan. In fact, when CH-5, WMAQ-TV in Chicago did an interviw with me, they showed a picture of Air Force I and said, this is Air Force One, then my my picture, saying, "and this is Glen Roberts," and broadcast the air force operator telling Congressman Michael, "Please stand by for the President."

Source record: 270283

I got a bc200xlt on June 1,1994 hoping to get one of the last units with the 800mhz mod. I was told that it was modable where I bought it, however, I waited so I didn't void the warranty right away. Well, today I popped open the case and to my surprise I found a VC-1147A (not the VC-1147) and no 10k resistor? I have already gotten allot of enjoyment without the missing frequencies so I am still going to keep it, but I was just wondering if anyone else ran across this in a bc200xlt? I know about the RS Pro's with the "A", but I haven't heard about any of the bc200xlt's. Just curious?

From: rxy5310@hertz.njit.edu
Message-ID: <1994Aug17.014034.7156@njitgw.njit.edu>
Source record: 270286

I am a scanner newbie with a few questions on
buying a scanner.
Here goes:

-I see that the new cellular phones (such as the Bearcat 200XLTN) are
advertised with a caption reading: cell locked. Are these cell locked
phones modifiable or only the older models?

-Are any mod's available for the Uniden Sportcat 250?

-How can I tell if a scanner is Cell locked? Will the scanner remain
silent through the 800'ish frequencies or is it plainly not possible
to enter those frequencies into the scanner?

I will probably be choosing between the:
Radio Shack Pro-51
Uniden Sportcat 250
Uniden 200XLT

Is there is a difference between the SC-250Y and the SC-250J
or the 200XLTN and the 200XLTJ models?

Great job, Glen....with the pending legislation being crafted to further prohibit the scanning hobby, your little publicity stunt phone call should go a long way to helping derail the silly legislation.

Further examples of irresponsibility in journalism. Hope you get really good ratings from your funny little stunt.

Can I suggest that the original poster refers to a basic text on Spread Spectrum Comms, rather than relying on often-conflicting net.hearsay. As an introduction, I would recommend Spread Spectrum Systems, R.C. Dixon, second edition, John Wiley & sons, New York, 1984. There are also many papers on the subject from IEEE journals and conference proceedings, some of which are good introductory tutorials.

Sometimes the confusion generated from a question on netnews can be quite unhelpful for a beginner in the subject- armed with the basics from articles and books, you can then start to understand specific systems, such as Qualcomm's CDMA proposals etc, or domestic phones using this system, but it is not helpful to dive in and be faced with the commercial views and popular misconceptions when you need the basic academic grounding, ie in m-sequences, pn codes, LFSRs, DS/FH/Hybrid systems etc.

The Icom radio was one ioof the few that with a little additonal ciruitry and software could follow a cell call as it hopped around. It could decode the control channel and provide you with al kinds of neat information. It can be used to servide a cell system or follow a given set of numbers if they should come up in the control channel. A perfect device for a detective on the move. If you had enough info about the structure of the cell ystem and tower locations you could even decode info that could give you a fair idea of where the subject cell phone was located.
There was a good article on this in Nuts and /Volts a year or two ago.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

This introduction is intended for people new to the scanning hobby and is oriented to scanning in the USA. It tells where you can buy your first scanner, what features it should have, where to get it repaired if required, how to get frequency information, and mentions a few scanner clubs worth joining.

Why Scanning?

Every day and night, scanner hobbyists are entertained by what they overhear on their radios. Police cars, fire engines, ambulances, armored cars, trains, taxis, airplanes, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Listen in the 46.61 - 49.97 MHz range to your neighbors deal drugs over their cordless telephone, or as their conversations are picked up and transmitted over the airwaves between 49.67 and 49.99 MHz by their sensitive baby monitor intercom.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots.

Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

You can even listen to the order taker's wireless microphone at the local McDonald's restaurant on 154.6 and 35.02 MHz!

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the ECPA. Change is in the wind -- when existing stocks are depleted, it will be illegal for companies to sell scanners which cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have recently enacted laws against listening to cordless phones, but it's currently legal to listen in most states. You can find out about these restrictions in a 39 page paperback, ANARC Guide to U. S. Monitoring Laws, compiled by Frank Terranella, available for $7.50 from ANARC Publications, P.O. Box 462, Northfield, MN 55057.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners bear the Realistic label but are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend AOR brand scanners.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't

make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners almost always provide more audio than portables, and portables are usually more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band unless you live in a very rural area where this band is not used. Usage of the 800 MHz band is growing by leaps and bounds.

If you're not sure whether you'll like scanning, don't want to spend much money, a 16 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often poor.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to most scanner owners.

Currently, the more popular scanners include the Uniden/Bearcat 760XLT (a/k/a 950XLT) and Radio Shack PRO-2006 base/mobiles, and the Uniden/Bearcat 200XLT (a/k/a 205XLT) and Radio Shack PRO-43 portables.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so. Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801, can extend reliable reception to 100 miles or more.

If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be somewhat more prone to lightning strikes because they are not at "DC ground."

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- Marymac Distributing (Katy, TX) sells Radio Shack | scanners at discount, but charges a 20% restocking fee | for returned merchandise. Telephone (800)231-3680 and | (713)392-0747.

- Scanner World (Albany, NY). Telephone (518)436-9606.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Many ham radio dealers, like Amateur Electronics Supply (Milwaukee, WI, (800)558-0411), also sell scanners.

Used scanners may be found at hamfests, flea markets, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

If you are handy with a soldering iron, you may be interested in modifying your scanner to add features or enhance its performance. Be warned this usually voids your warranty. Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

ftp.cs.buffalo.edu
garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and stocks parts for several older models. G & G sometimes buys old scanners, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores.

I also recommend the book, Monitor America, 2nd edition published by SMB Publishing, and available from Grove Enterprises for about $25. This single edition contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more

sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's 168 page Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 6th edition is available from Grove Enterprises for about $19. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and Kneitel's sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. It will likely disappoint experienced scanner hobbyists and is better suited for beginners. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The DOS access software is somewhat | difficult to use and the frequencies are displayed with | annoying leading zeroes.

Grove enterprises sells FCC license information on floppy disks. Disks for each state are sold separately, and the information is basically the same as the FCC "state sort," i.e., transmitter location (state/city), callsign, licensee

name, and type of license. The DOS access software is | easier to use than the PerCon CDROM.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio users to identify their operations with their assigned call letters, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in

1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $24.00 per year, which includes the monthly RCMA Journal, which consists of approximately 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

AOSC questions can also be sent electronically to:

rccons!aosc_hq@telerama.pgh.pa.us or
dave.marshall@f240.n108.z1.fidonet.org.
FidoNet: 1:108/240.0

AOSC also has a MEMBERS & EDITORS Scanner related echo, AOSCNet, distributed via FTN on 6 BBS systems, and via Internet Mailing list. Rick Christian advises these strict rules for the AOSCNet Scanner Radio Echo (as of 2/1/94):

1. No discussion of cellular modifications or discussions on how to monitor cellular transmission.
2. No discussions on topics which would violate the ECPA '84, TDDRA '93, (18 USCA 2510 et seq.) or Communications Act 1934 & 1984 as amended (47 USCA 705), i.e., decoding/reception of paging, cellular, encrypted stuff, descrambling etc..
3. No Aliases.
4. No discussion of Shortwave or Amateur Radio material (except SAREX).

For info on the ECHO only, contact:

R.E. Christian, AOSC PA/AOSCNet Founder
PO BOX 12763,
Pittsburgh PA 15241-0763.
FAX: 412-831-5860.

Internet: rccons!aosc_pa@telerama.pgh.pa.us
rccons!aoscnet_hq@telerama.pgh.pa.us
rick.christian@f220.n129.z1.fidonet.org
FidoNet: 1:129/220.0

To receive a file of info on the All Ohio Scanner Club via Internet send to: rccons!ftpmail@telerama.pgh.pa.us

In body: get aoscinfo.zip

This will send a UUENCODED info packet to you. The file contains an outline of the material you will find in the American Scannergram, the AOSCNet, and an application for membership. (Note: This file will not be sent back to *.fidonet.org addresses.)

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members sometimes sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $10 check, payable to Kim Moran, to:

The Command Post
attn. Kim & Ted Moran
6143 W. Touhy Avenue
Chicago, IL 60646

Many CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

Here is a tentative meeting schedule for the remainder of 1994. All meetings will be held on Saturdays at the Destiny Restaurant, 1440 Rand Road, Des Plaines, IL:

October 15
December 10

Bring a notebook and your appetite.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

I am often asked, "How do you find these frequencies?" Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books

The most convenient source of fire and police frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores for under $10. Police Call is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. Later editions have included a few pages of local airport and nonsensitive federal government frequencies.

I highly recommend Richard Prelinger's 1992 book, Monitor America, published by Scanner Master Corp., and available from Grove Enterprises for about $25. This second edition is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the world's largest scanning club, the Radio Communications Monitoring Association (RCMA). Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Beyond Police Call, available from several sources including Radio Shack, covers the business, schools, and other stations not covered by Police Call, its sister publication. One volume covers the entire USA, but no call signs are shown.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The second edition is about 400 pages and is available from Official Scanner Guide. The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $20. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is the best book in print for this difficult to obtain information.

A more accurate, but smaller and less comprehensive book is Midwest Federal Frequency Directory. It was published in 1986, and copies are getting scarce. Copies may still be available for $10 from Scan America.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells the information on PC floppy disks for each state instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The DOS access software is somewhat | difficult to use and the frequencies are displayed with | annoying leading zeroes.

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)1. Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'2.

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 95 pages long. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. A recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542
Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

The real challenge is deriving new spectrum usage information. Sometimes it requires several days of

listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

More about sleuthing will be discussed in Part II of this article.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?
Part 2: Sleuthing

by Bob Parnass, AJ9S

Part I of this series discussed how scanner enthusiasts can obtain frequency information from books, government microfiche records, or other listeners. This installment discusses digging up new frequencies on your own.

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto

terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described in Part I of this article, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals

weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

Anybody with enough money can buy a brand new scanner, but you can save lots of money if you get a good deal on a used scanner. Hamfests are probably the best place to find used radios, but you must be familiar with the equipment. Hamfests are repleat with older radios you won't see in today's catalogs.

At last count, there were over 70 scanners and monitor receivers of various brands in my collection. I purchase most of my receivers at hamfests or horsetrade with other radio hobbyists. This article describes a few of the FM receivers in my collection, and is not meant to be complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Several people have been pleased with Electronic Repair Center, in Franklin Park, IL, which repairs scanners for a flat fee. Call them at (708)455-5105 to find out their current rates. G & G Communications (telephone 716-768-8151) is another scanner repair company. This family owned company repairs scanners and stocks parts for several older models. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the first Bearcat models, did not provide individual channel lockout capability. Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series. Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor

performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Bearcat BC-101, Radio Shack COMP 100, and Tennelec MCP-1, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot on the front panel.

More Modern Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

Radio Shack scanners contain a reasonable number of features. All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. A few years ago, the Regency and Bearcat scanner lines were purchased by Uniden, a Japanese company, and production was moved to Asia.

My favorite VHF/UHF receivers are the 300 channel Radio Shack PRO-2004, the newer 400 channel PRO-2005 and PRO-2006, and the ICOM R7000 and R7100. The ICOM models are more "communications receiver" than a conventional scanner.

Other favorites include the Bearcat 300 and 760XLT, Regency M400, and the Regency K500 (predates the M400), all of which include a "service search" feature.

For portable use, I prefer the Radio Shack PRO-43 and Uniden/Bearcat 200XLT. |

Obtaining Crystals |

If you do purchase a crystal controlled scanner or monitor | receiver, you will probably want to buy more crystals to | cover local frequencies. |

Scanner crystals may be ordered from your local Radio Shack | store or from one of the companies below. Be sure to | specify the operating frequency you want and the brand and | model of scanner. |

Some companies may ask you to send a schematic of the | scanner or require more detailed information, like series | or parallel resonance, load capacitance, etc. |

ICOM

R-7000: At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator

radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but has better IF filtering and contains front-end circuitry for VHF-low, VHF-high, and UHF bands. No aircraft band coverage. Three crystal filters. Front mount speaker sounds good. No rescan delay.

Bearcat 12 (Electra): One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

BC101 (Electra): First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC220 (Electra): 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): A BC220 but with 40 channels. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding

components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

800XLT (Uniden): 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast.

Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels.

BC100XLT (Uniden): Excellent 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): Excellent 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up ad hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of

direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Radio Shack

PRO2004: Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio.

PRO2005: Radio Shack's top of the line scanner for 1989 and scanner of choice. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although there is no mobile mounting bracket available and the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended.

PRO2006: Radio Shack's 1994 top of the line scanner. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended.

PRO34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow

control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO24: Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different than the common series resonant crystals used in Regency and Radio Shack scanners. Sometimes, Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the

rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2526	10	X		yes	yes
FR2526	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Radio Shack didn't try to 'slip' one in on anyone. The FCC either tests
comm. devices directly or uses authorized centers to perform these tests.
These units were obviously manufactured before the law and can legally be
sold. Unfortunately, RS runs like a scared cat even w/out just cause.
They can liquidate their immediate stock but RS may play it safe and
non-controversial (probably in fear of what the media, not the government
might do).

Andy

I have the Uniden 890XLT and had the 'A' chip in it. It was still modifiable.
The A may have nothing to do w/the mod.

I also picked up the PRO-51 and had an 'A' designator in the serial number
but still was modifiable (the keyboard trick).

Same as the scanner situation, when the dealer stock runs out. I suggest getting one soon. These use user-serviceable parts (UHF mixer transisitor) so the converter will outlive you and all your future scanners. I use one w/an old Uniden 100XL and it works great!

Source record: 270305

Am I better off to buy an AOR 1500 with no gaps or purchase a Uniden (I forget model number) and have it modified to get full 800 Mhz? Also I realize that the RS 2006 is not portable and that is not critical, but do these work well once they have been modified for 800 Mhz? I am trying hard to make a purchasing decision? I have a pro-43 (unmodified) would I be better off to modify it? I'm really confused, please help! In the end I would like to have two scanners. Also let me know which new ones are modifiable.

Source record: 270307

Recently someone posted a message about a police officer who didn't like scanners and scanner owners, calling the "ambulance chasers" - well, here's some hard facts you can give them from my experience:

1.In all the police calls I have listened to, I have NEVER heard of a situation being botched because of a scanner listener.

2. I have at least THREE times assisted the police department with calls because I was listening to my scanner:

1.I heard a police call to my neighbor's house saying that he had come home and found a burgular (This was during a big spree) While the police were across the street questioning my neighbor I heard rustling behind my house and called the station - he was later apprehended after a chase.

2.I heard a police call in my car that there was someone driving a car who had threatened suicide. I was looking at the car when the call came in and stopped & got on the payphone to the police. I don't know the outcome because I left the receiving area.

3.Police call that there was a fight at the complex next to my house . I looked out the window & saw three youths jump the fenceinto my complexes back yard - the cops didn't have a clue where they were until I called.

In my opinion, the officer the person spoke to, and any other officer who hates scanners, is just a cop with an attitude. I work in a hospital ER, and believe me, there are alot of them, but this is certainly not true of most.

In the city I work in, I think most of the cops don't like scanner listeners because they don't want people to know how little they do. The city is seriously overstaffed and there is an extremely low rate of crime for the city's population. Some of the cooler cops have even expressed to me how sick they are of sitting on their ass all night. Most people think cops wind up in situations like those on TV all the time, well, in my city, that just ain't true - but the cops would love people to think that. The reality is that they spend most of their time kicking drunks out of Dunkin Donuts and sitting outside the only popular bar in town waiting to stop people as soon as they drive off.

Cops who hate scanner listeners will tell you how they foul up their job, and this is a crock of shit. They just don't want you to know what their job is REALLY like. Cops without attitudes will tell you they appreciate the help!

Car radios do search a specific set of frequencies between preset limits, just like scanners that have a specific service search. With the current trend in Congress to enact vague laws, you can bet that car radios could be included, intentionally or unintentionally, in any scanner ban bill.

In my younger days when I cruised the city, my friends and I would listen to our scanners. We would keep an eye out for any vehicles or people that the cops were looking for, and when we saw them, we would inform the cops. They knew we had scanners and occasionally ask for our help. I also offered my fire extinguisher to an officer who had an electrical fire in his patrol car. The FD was on the way, but he was grateful and thanked me anyway.

BTW, the cops, firemen, and state troopers that I know have scanners so they can listen in when they are off duty. They also have scanning tranceivers in their cars with ALL local freqs in them. If any cop says he hates scanners or scanner owners, he/she is a hipocrite.

By contrast, our local police and county sheriff personnel can be extremely busy. The other night, I was listening on the scanner and a call came in about an accident on the interstate. Initially, they were having some problem finding the location. I also had my HAM rig and was about to call in some more specific instructions when someone else beat me to it.

A working partnership can be made between scanner listeners and the police. It might help if the police communicate their expectactions(for instance, work through 911; don't go to the scene, etc.). This is no different than working another aspect of the neighborhood watch program. We need to be good citizens and not get in their way. Being overly helpful can be just as bad as being non-helpful(or worse).

From: cbarrera@austin.ibm.com
Message-ID: <CupA7o.26t1@austin.ibm.com>
Source record: 270319

I have a Realistic Pro-37 that is just a few years old. It is quite a capable scanner, and even though it is no longer listed in the Radio Shack catalog, its closest (almost exact) equivalent, the Pro-39 was selling for $299 (typical over-inflated price). Anyhow, the case is still in great shape and there are no problems with it, so how much should I try to sell it for? I would like to invest the money into a decent Shortwave receiver.

Oh, for those not familiar with it, it has 200 channels in 10 banks plus 10 channel monitor, does 30-999mhz, except for cellular freqs, and a few other frequency bands (don't remember off the top of my head, there are more than a few gaps in its range, but does 31,000 total frequencies). Can specify limits for scanning frequencies etc...

(p.s. it hasn't been modified in any way, don't know if it can be done on this model, probably could but don't really care too much. Ready to sell it)

thanks for any info.

I just found out that this is the case with mine. I haven't had much experience with surface mount stuff and what I didn't think was the 10k resistor was actually just that. It was labeled "103" instead of stripes. I assume that this means 10E3 which would be 10,000 (ie: 10k). In a hasty move to get what was the last of the converters, I already ordered the GRE Scanverter II before I figured it out. It meant some more money now, however, it will be nice to port the converter to any other scanner in the future.

Thanks!
-Andy

jeh@cmkrnl.com (Jamie Hanrahan, Kernel Mode Systems) writes:
: to steal service from anyone". This bill was written because prosecutors in
: L.A. and other places where cell theft is rampant have *asked* for it as a tool
: to fight this particular problem.
:
: Yes, it has potential for abuse by prosecutors and police officers. So does
: nearly every other provision of the various city, state, and u.s. penal codes.
: So this alone is not sufficient reason to complain about this bill.

Bullshit. As others have stated, it is an excellent reason to reject the bill.
If they want to make it illegal to clone phones, then it would be simple to
write a two or three paragraph bill which directly addresses that point.

There is no need to produce such a broad sweeping bill as the one that has
been introduced.

... deleted ...

: computer, PROM burner, cellphone, etc. I fully expect that the response I'd
: get would be similar to: "but that's already stated in the text -- this bill
: only covers use of such equipment to modify cellphones and similar equipment
: with the intent of theft of service".

Exactly - even if that is NOT what it says.

For example: assume that a Ham uses an adjacent frequency, and has his
HT modified so that it receives the cellular frequencies. He also is an
experimenter, so he has a prom burner. Many Hams also have a PC, and use
various software to decode some of their transmissions. Now, all of
this could be interpreted by the police to show "intent" to obtain illegal
access. That equipment, and the way confiscations are going these days,
all other radio related equipment (and possibly even your house and car)
would be confiscated.

How do you get it back? You go into court and sue to prove that it was
not intended for illegal purposes. Note that you would probably not even
be charged with a crime - the confiscation is a civil confiscation, not
a criminal confiscation. Sound far fetched? Check out the drug seizures.
It is pretty hard to defend yourself, when everything you own has been
confiscated as "tainted", including your checking and savings accounts.
Even if you win, you can be out tens of thousands of dollars.

Bill

: Well, I just received my OPTOSCAN 456 today. :-(
: No Installation instructions. :-(
: No Installation video. :-(

Okay. The physical installation was pretty easy! :-)
I used the OPTOELECTRONIC advertisement pictures as a guideline.

I just have a few questions:

1] Where do I put the 9v battery now?
2] I need to hook the cables up to the OPTOSCAN board. The
OPTOSCAN came with three connecting cables.
The PRO-2006 has three multi-color connecting cables.
What goes where?
3] There are two single wire connectors on the underside of the
OPTOSCAN board, one is labled AUDIO, the second is labeled ANALOG.
Where do these connect to?

TIA,
Paul

: <stuff deleted>

: Well, last Saturday I made a $200 purchase at Radio Shack. I noticed their
: new catalog on the counter, and asked if he could put one in the bag with
: my purchase. He said it would be $2.00, even though I'm making a purchase
: 100 times that amount! I didn't bother to buy the catalog...

What you should have done (as I *would* have) is run the item back through as a refund, bought the catalog and then bought the item again using the $2 coupon on the front of the catalog. It would have annoyed the heck out of them, but they could not refuse it.

As per others' comments. I have very strong principles -- I will go to great lengths to receive what is expected, time and money mean nothing when you're talking about *my* principles. But, if more were to do as I did, they would get a message - loud and clear!

What you may also not realize is that I am a good customer of this store (and two others in the area), but would not feel it right to have to wait until I *need* something to obtain a catalog! Other reasons for catalog are -- when they raise the prices, initially, the computer knows the new prices, and from scanning old to new catalogs, you can figure what's gone up. But, wait, if it is advertised in the store at a LOWER price, you can demand they honor that price -- otherwise you can file complaints with the BBB for fraudulent advertising. Normally, I am the last person to get it at the "advertised on the peg price" as they then decide to remove the price from the peg. They do it in the form of a price change, and I have done it many, many times. But, if you wait on the catalog, you will not know until after they have pulled the peg prices!

The other little detail missing is that these stores are within *walking* distance of each other. The reason being is one is targeted for nearby city *without* a Radio Shack in the city limits and the other for the adjacent city/county. So I did not waste much time or gas going back and forth. I took the express route home, grabbed my receipt from prior weekend, dashed over to first shack, they were out, went to second, bought items and obtained catalogs, stopped by other on way home, got money back with sunday receipt. Both are within a bicycle ride from where I live, the car simply made it in 4 minutes instead of 15.

Anyhow, who can put a value on principle? I know the amount of mileage $4 would have bought would be around 90, I went about 4-5 all totaled -- and then there is the cost of satisfaction, also has a high price too!

(When federal express last weekend failed to deliver a package marked saturday delivery - urgent, to *me*, because they "mis-sorted", I had to explain to them, since this package was using the most expensive domestic service you provide, how do you plan to deliver it now? They first said "monday". I said "not good enough". They ended up eating the shipping -and- sending it via commercial airline counter to counter service from phoenix. Then they fouled up again, and it sat until 1am SUNDAY morning. It was later delivered at 10:35am via special courier. I found out later the total charges they lost or spent exceeded $200. Hopefully they will learn to be more careful next time. I feel I some what subsidized the delivery though -- as I use them frequently and what I pay is NOT cheap! It is nice when I get a little back...)

Remember, federal express never loses anything, it is merely ... *mis-sorted*. If you asked them what is the difference between lost and they not knowing where it is, they say "we are looking for it". I guess the answer is time. I was satisfied when it finally came, I used them because UPS is not quite as reliable, and I knew I could count on them to bring it through. I won't forget the last comment I made -- "Do you think I will see it today (sunday)?". Answer, yes I think so!

Jack,

Here are some frequencies from the Southern CA Police Call:

Location	Base	Mobile
West LA	42.44	42.76
South LA	42.56	42.72
San Diego	42.88	42.66
Oceanside	42.12	42.20

Since this isn't a repeatered system, don't use "delay" if you want to hear
both sides of the conversation.

In addition, the vehicular extenders are on 154.905.

Marc Rich
email: rich.marc@std.teradyne.com

From: mc@shore.shore.net
Message-ID: <336j52$5qt@shore.shore.net>
Source record: 270177
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I was up in New Hampshire today and just happened to wander into a RADSHACK store and learned that the PRO-2006 scanner has been priced down to $359.98. So, now I own one.

I have owned a PRO-2004 and performed the mods that I thought it needed. Now I have to decide which one I will keep. I'd be curious to read any comments and observations from any readers who have owned both radios and which one they preferred and why.

For those of you who don't own a PRO-2006, now is the time to get one brand new in the box if you are ever going to! Remember you can return it within 30 days if its in saleable condition in the original box, so you can really make the decision over a few weeks of playing with it in the privacy and comfort of your own home. I do NOT work for Rat Shack - in fact this is the first thing, other from small parts once in a while, I have ever purchased from them! But the PRO-2004,5,6 are excellent radios and so I feel that my aversion to their stores be overridden by a desire to share this news and information with other enthusiasts.

Dh> But Steven, you DID pay for those catalogs--you just didn't pay Radio
Dh> Shack. You paid the gas station. And you further paid by wasting a
Dh> chunk of your most valuable assett--your TIME--by running from store
Dh> to store to avoid the refundable fee for the catalog. A perfect
Dh> example of being penny wise and pound foolish.
Steven is right, I went into a RS just the other week and asked for a new
catalog, looked at the price of it, and promptly told the ordertaker
that I wasen't going to pay $2 just to see what else I could buy from
them. The way I see it, that's just like asking for admission to
go into their store and buy stuff.
So I got the catalog anyway because I convinced the manager to see
the error of his ways, and not to loose a good customer over $2.
IMHO ;)

Time to tune into the reality channel....

What you say above is absolutely true: You can monkey with your own gear, if you can get it. Using it is another story. Now, here's our lovely government at work....

The ECPA makes using the gear illegal. This is impossible to enforce widespread, and the legal folks know it. So they took the next logical step: Cut it off at the source. They made it illegal to MANUFACTURE equipment which is capable of receiving the forbidden bands. So most manufacturers modified their scanners so that reception could be enabled or disabled by adding or cutting a simple jumper. It was cheap, and it followed the letter of the law. (I'm one of those who thinks that the manufacturers used this method because it was the most cost effective solution to an engineering problem...NOT to protect scanner enthusiasts).

But the legal guys didn't like what was happening. They saw just as many scanners being used, and an entirely new market being created for modifications. Not only that, scanner usage might actually have INCREASED. Some people probably got a kick out of it more since they had to pop the thing open and cut a "secret wire" (sort of like the bozos who used CB radios with Linears).

So, the legal folks made it illegal to manufacture equipment which is "EASILY MODIFIABLE" to receive the forbidden frequencies. So now the manufacturers have to design their units so that they are practically destroyed if you try to modify them. They do this by sealing key chips in epoxy, blasting new ROMs, etc.

It's happening all the time in our current government. It's just like the clipper chip stuff. "Oh, we won't make it ILLEGAL to use someone else's equipment. But if you deal with the government, or want to export your gear, you HAVE to use it". This sort of back-door tactic works sometimes. Mainly because the political hacks can get on TV and, with this "How-can-you-think-we'd-do-such-a-thing" expression on their face, say in a pleading tone: "But Peter! We're NOT making it illegal! They're just blowing this whole issue out of proportion...." And, technically, they're right. It puts the other folks on the defensive, and makes them look like extremist morons.

No, well, yes, well...

They say its $2 off your next purchase. If they won't do it on the
spot (ask before the sale is made), purchase the catalog alone for
$2, then use the coupon and make the next purchase. This will!

: FOR FIVE BUCKS(OR YOU CAN SUBSCRIBE).

Umm, a couple of points here. First, Racing Electronics sells the frequency lists for $15, not $5. You can subscribe for about $20 as I remember. I did, however, buy a racing headset from them that works very well. It sure beats the in-the-ear earphones covered with hearing protectors that I had been using!

Second, for the last year I've been compiling frequency lists of the IndyCars. On Thursday of the Mid-Ohio weekend I programmed all of the frequencies into my scanner, and on Friday I put a delay on each of the active freqs to mark which ones were being used. I was surprised to find that by Sunday many of the frequencies had changed. I'll try to post my big list in the next couple of days if I get a chance.

: P.S.PENSKE ONLY SCRAMBLES DURING PRACTICE NOT THE RACE

Right, I wonder if ABC paid off Roger to unscramble on Sundays? The in the pits commentary wouldn't be nearly the same without starting every sentence with "Roger just radioed to {Little Al, Paul, Emo} to..."

: MANSELL 461.287 468.225 462.137(I DON'T KNOW,COULD BE A BABY MONITOR)

Nah, as funny as this is, I have to disagree. The baby monitor crack should be appended to Paul Tracy's frequency. If I had a dollar for every time I heard him say f**king bullsh*t during the race, I could retire at 22.

: (KING)MATSUSHITA 464.912 467.562 467.550

How can you call him King? Gee, he's so competitive this year! :-}

: INDY CAR 462.037 464.750 464.500 462.812
: SAFETY 461.787
: RACE CONTROL 457.012
: CART NETWORK 455.800 462.000

For anyone who has never listened to these freqs, they provide the most bang for the buck. As an example, Paul Tracy slid past another car during a local yellow at Mid-Ohio last weekend. As most of the crowd was cheering, I was thinking, "Hey wait a sec. That'll be a black flag." Sure enough, when I turned on the IndyCar control freqs, I heard a

report of "Number 3 passing under yellow." After some discussion he was black flagged about 10 laps later. The crowd was shocked (especially two drunk Canadians sitting two rows in front of me) and couldn't figure out what was going on. I had a rapt audience of about 5 rows as I explained the situation.

: BE SHURE YOU HAVE A GOOD HEADSET AND ENJOY,NCS

I second that one!

Jack Diem (jdiem@netcom.com) wrote:
: Is there anyone who could provide me with the radio freqs. that
: the CHP use to patrol the FWY between LA and San Diago? TIA.

There is Gold 42.2Mhz for mobile, 42.12Mhz for the base for san diego county.
The orange channel 42.88Mhz base and 42.66Mhz for the mobile is probably
used towards the city of san diego.
Further north there is the gray channel for capistrano, south orange
county. 42.48Mhz for the base and 42.68Mhz for the mobiles.
Further north yet is the santa ana office on 42.4Mhz for the base and
42.16Mhz for the mobile.
In LA county there is nine channels used. Be careful about frequency
re-use. both san diego channels are reused in LA county. Its a fine
example of the usefulness of a PL decoder.
Scannists with good low-band antennas in the mid-west & east coast can
surely pick these up when conditions are in. the Los angeles area uses
the CTCSS frequency of 192.8hz.

> Oceanside 42.12 42.20
> In addition, the vehicular extenders are on 154.905.

Note that monitoring these is not likely to help anyone avoid getting caught speeding. I've yet to hear a CHP officer announce "I'm back on patrol, north on I-5 from the Hill Street interchange," nor "possible speeder in number one lane", etc. The vast bulk of CHP's radio traffic (what there is of it) is generally limited to driver's license, plate number, and VIN checks... all of which happen after they've stopped someone. And even then, they rarely announce where they are.

(I wonder about this. Suppose someone surprises an officer during a traffic stop? Do they have an emergency call button on their belt, or something? And even if they do, how does the base know where to send help?)

Hearing the officer's side of this traffic on a mobile channel, or both sides on the vehicular extender channel, does tell you that there's a unit *already stopped* near you; this doesn't mean that there aren't others still on patrol nearby.

Very infrequently, you will hear a pursuit.

I used to think that monitoring CHP freqs could help avoid accident scenes in the LA area, but you have to be very lucky to hear them as they aren't often repeated. The large number of freqs used by CHP in the area is part of the problem (you can't just monitor the freqs for the area you're in, since you also want information on the area you're going to and the areas you'll be passing through on the way to get there). Monitoring KNX (1070 AM, traffic reports every six minutes) seems to me to be more effective.

Radio Shack has a carrying case with a belt loop. Can be used for
scanners, walkie-talkies, cordless phones, or carrying your pet
lizards in. It sells for $9.99. Ask them to order part #20-024
if they don't have it in stock.

With me, I think it would have been just plain-good customer courtesy to give me the catalog on the spot. I made a $200 purchase, and if I wanted it for free, I would have had to get in line to buy the catalog, buy it, walk out of the store, walk back into the store, get in line again, and use the $2 coupon for my $200 purchase. A total waste of time, and also giving their customers the run-around here. It wasn't as if I was just making a purchase of a couple of batteries to use my coupon, but for a major purchase....

I think their knowing that we CAN listen in makes a difference. A good practical illustration of this can be had by anyone within receiving range of Oak Park/Forest Park/River Forest. They have two frequencies, one with a repeater on 154.845 MHz and one a simplex frequency on 155.115. If there's ANY silliness, off-the-cuff commentary or anything that sounds the least bit "unprofessional" (or could be taken that way), it never appears on the main frequency. Even then, it's rare.

I know (as most any scanner owner does) of quite a few secondary simplex frequencies like this, and they're about the only place one can hear things like "Congrats on the new baby!" or "She's LOOKING at you, Ted,"which "don't belong" on official frequencies. One can be sure we'll never hear "Shake him for some money; the ticket will never stick." (Not that that is never ever said; just that it won't be facilitated by radio, which would keep the incidence down in any event.)

You made one mistake... We are talking about low-life droids who
work for the Rat Shack. They are not paid to make good decisions,
and if they knew how to make good decisions, they would -not- be
working at Radio Shack. If they knew enough to give you the catalog
on the spot, they would have been overqualified for the position!

The guy MAY have learned something if you were to have turned around
and said "catalog or write me a refund!" BTW what was it you bought
for $200... you should have given the guy the privilege of filling a
return for his own stupidity and losing is commission on it at the
same time. In my area I am blessed with around 8+ Radio Shacks, it's
not hard to get what I want -- basically someone has to think, since
they do not, I do it for them.

Oh well... Don't get me wrong, the droids at my local Rat Shack
are friendly droids :-) but they are nevertheless, droids.

If that won't work, tell them that in that case you'll use the $2 coupon for your next RS purchase... and that that and ALL subsequent RS purchases will be at another store.

THAT will work.

WHile you're at it, tell them that you understand that they can't afford to give catalogs away to every mall rat that asks, but you're tired of this crap with bona-fide purchasers.

Does anyone know of the laws in Canada or Mexico about stores being able to sell radio scanners that are modifiable to scan the cellular spectrum? I'm curious here. Is it as tough as the U.S. law, which I now think makes it illegal to sell this product as of April, 1994, once all existing stock is depleted.
Would anyone think U.S. Customs would confiscate such a device, if one was to try to bring one back that they purchased? Does customs go about confiscating radios? In my experience in traveling to Canada, I've never had a problem coming back to the U.S. I've been through Vancouver & Toronto airports, and each time U.S. Customs seems to just wave me by, sometimes not even wanting to see my ID or airplane ticket.

Any answers?

Here in Europe the GSM system is developing very rapidly. In fact faster than
anyone has ever predicted.

> ..... And, as now but
>even more so, the service providers will subsidize the cost of the
>phones to encourage customers to switch over. Note too that the
>providers are primarily interested in the heavy business users of
>cellular phones. That's where the money is, with high monthly usage.
>If they cut off some customers who don't use the service much by
>shutting down the analog nets, they won't cry about that. There's
>no universal service mandate for cellular.

This is exactly what has happened here in Denmark. The old analogue net NMT
(Nordic Mobile Telephone) was monopolized, but for GSM, there are two
operators fighting for market shares. This has led to extreme cases
where some of the older (first generation) GSM phones was actually
given away or sold at very very low prices together with a subscription.
It actually went so far, that the authorities has to introduce limiting rules
for this subsidarazion. It was feared that in the end the subscribers
would have to pay for the competition.
But still you can get a new digital GSM phone for around 3000 DKK
(about $400).

>>And if digital becomes
>>a standard, will there be a new generation of 'digital scanners', able
>>to detect digital, and translate it?

>No. Intercepting cellular calls is illegal now, there won't be scanners
>legally sold to decode digital cellular in the future unless the ECPA
>is repealed (very unlikely).

In fact European police has got a problem now. Even with a court order,
they are not able to intercept GSM conversations. This is because
there has not been developed equipment for this. The companies
certainly don't see any interest in financing such a development, and
the authorities has really been sleeping.

However, expect the analogue nets to stay for some time. Here in Denmark Telecom who runs the old analogue NMT systems and one of the GSM nets are trying to market the NMT system for private customers. This is done by the introduction of low subscription rates and reduced call charges outside business hours.

Don't expect good performance below 30 Mhz from a unit mainly designed
for VHF and UHF.

As for 200-400 Mhz this is mainly military aircraft using AM. Because
of the size of this band it may be hard to get anything just be searching.
A better way is to obtain some exact frequencies used by a nearby airforce
base and program these in.

Does anyone know the input frequency for Hamilton County Ohio's fire repeater?
Also looking for PL tone freq's, if any.

How about PL tone freq's for Dauphin County, Pa fire?

Low band skip has been particularly rewarding this year.

>Recently someone posted a message about a police officer who didn't like
>scanners and scanner owners, calling the "ambulance chasers" - well, here's
>some hard facts you can give them from my experience:

>1.In all the police calls I have listened to, I have NEVER heard of a
>situation being botched because of a scanner listener.

I have been involved in several calls in which scanners have caused very
serious problems. We had a situation where the was a man with a gun and
several scanner listeners came out to see what was going on. Many people
could have been hurt. We also have a problem with kids vandalizing and
stealing items. They all carry scanners and it makes it very tough to get
backup on a situation when they know when it is coming. I feel that you
think that scanner listeners are primarily good and helpful. Well, you are
wrong.

>2. I have at least THREE times assisted the police department with calls
>because I was listening to my scanner:

> 1.I heard a police call to my neighbor's house saying that he
> had come home and found a burgular (This was during a big spree)
> While the police were across the street questioning my neighbor
> I heard rustling behind my house and called the station - he was
> later apprehended after a chase.

> 2.I heard a police call in my car that there was someone driving
> a car who had threatened suicide. I was looking at the car when the
> call came in and stopped & got on the payphone to the police. I don't
> know the outcome because I left the receiving area.

> 3.Police call that there was a fight at the complex next to my house
> . I looked out the window & saw three youths jump the fenceinto
> my complexes back yard - the cops didn't have a clue where they were
> until I called.

> In my opinion, the officer the person spoke to, and any other officer
>who hates scanners, is just a cop with an attitude. I work in a hospital ER,
>and believe me, there are alot of them, but this is certainly not true of most.

I am one who could care less if people have scanners in there homes as long
as they stay away from the scene.

And yes I have been assisted by scanner listeners on more than one occasion.
And yes I appreciate the help as long as they stay out of the way.

The reason cops get an "attitude" is because they get tired of people sticking there nose into situations where they just cause more problems. I know I am one. I ask everyone to be more tolerant because until they have a life placed in jeoprady or a case botched because of a scanner, you can never understand.

> In the city I work in, I think most of the cops don't like scanner
>listeners because they don't want people to know how little they do. The city
>is seriously overstaffed and there is an extremely low rate of crime for the
>city's population. Some of the cooler cops have even expressed to me how
>sick they are of sitting on their ass all night. Most people think cops wind
>up in situations like those on TV all the time, well, in my city, that just
>ain't true - but the cops would love people to think that. The reality is
>that they spend most of their time kicking drunks out of Dunkin Donuts and
>sitting outside the only popular bar in town waiting to stop people as soon
>as they drive off.

It sounds to me like you have a bad attitude. Give them a break. Unless you are a cop and in the situations they encounter then I recommend you just quiet down. I feel sorry that you have such a poor opinions of cops, because without them we would all be in a world of hurt. You are right law enforcement isn't like on TV. It is 90% boredom and 10% terror, but remember that 10% may be the ultimate scarifice(i.e. his/her life).

> Cops who hate scanner listeners will tell you how they foul up
>their job, and this is a crock of shit. They just don't want you to know what
>their job is REALLY like. Cops without attitudes will tell you they appreciate
>the help!

AND FINALLY.
Did you pull your conclusions out of a cereal box? Do you have first hand experience? I think everyone just needs to just relax and slow down. I can tell you do not know much about cops because there is no such thing as a cop without an attitude, trust me I have been around quite a few more than you have. Before you go running your fingers off, I ask that you try to think because you are just going to make it worse for yourself in the long run.

|> to scan transmissions that are legal to intercept such as unscrambled
|> public safety and amateur.
|> Gary

Gary: you dodged the question! Park the political correctness and stay technical! Your insight is good; I have several printouts at home that are your posts (lightning protection and SWR arguments). There is nothing wrong with _talking_ about scanning cellular phone calls. And plus, it is entirely legal.

In Canada.

To answer the reader's question: scanners are able to receive an incredibly large number of transmissions: marine, aircraft, public safety, search and rescue, fire, taxi, security, Mick Jagger's wireless microphone, amatuer radio, satelites, ambulance, public weather stations, military operations, air shows, cordless phones, drug busters and the list goes on. As services go digital over the next couple of decades, today's scanners will slowly become less versatile. Don't hold your breath though... these things take a lot of time.

jkearman@arrl.org

810. Radio Shack PRO 2028

Newsgroup: rec.radio.scanner
Date: 1994-08-22 14:31:32 UTC
From: carpene@lastlaff.EBay.Sun.COM
Message-ID: <33acs5$rhn@male.EBay.Sun.COM>
Source record: 270219

I just picked up the PRO 2028 for under $80.(NEW). The band coverage is between 29 - 512 MHZ. I'm a novice to scanners and I'm curious....given the price, is it worth it to hold on to this unit? Or should I opt for spending a lot more to gain access to the upper bands? Also, this is a discontinued model. So, I'd appreciate hearing from anyone who has had any good/bad experiences with this model.

Thanks.
Marc

811. Damark and the BC-200XLT

Newsgroup: rec.radio.scanner
Date: 1994-08-22 14:33:20 UTC
From: lee@tosspot.sv.com
Message-ID: <0LRgRc1w165w@tosspot.sv.com>
Source record: 270221

For those who may be interested, Damark (800) 729-9000 still have stock left of factory reconditioned Uniden Bearcat BC-200XLT scanners. The catalog number is B-9055-200551 and the price is $169.99 with $6.50 shipping and handling.

I have ordered and received one. Cosmetically it is indistinguishable from new. Ni-Cad pack, carrying case, duckie and wall charger are provided.

The 800MHz modification and the battery modification were simple, the pcb exactly matched the layout detailed in the ArtSci scanner modification book.

The sole negative is the 12.5kHz stepping rate in the cell band.

So, if you want an inexpensive and uncrippled handheld scanner, you could do a lot worse than to buy this model from this source.

BTW, the ordering desk at Damark may have the prices bollixed up, the price I was originally quoted was $199.95. If you point out to them that catalog #B-9055 has it listed on page 55 at the $169.99 price there should be no problem.

>I can tell you do not know much about cops because there is no such thing as
>a cop without an attitude

I have had several friends who have been cops and state troopers and they have been the nicest people you would ever want to be around. BTW they own and listen to scanners and don't care if eveyone else does either.

On the other side of the coin, my next-door-neighbor is a city cop. He is frustrated about not being promoted and paid next to nothing. What does he do? He is a bully. He teaches his kids how to beat up other kids (He's a black belt). He is a wife beater and has had several fights (fist and verbal) with his wife outside. When he yells at his kids, you can hear it two houses away! He has an attitude. A violent attitude that makes me want to stay as far away from him as possible.

What does this have to do with this newsgroup. He viscioulsy insults me about being a scanner user and even for using my ham eqipment.

It seems to me that the attitude that cops have about life in general can affect their attitude about scanner owners.

>refund! We really need to make it as difficult as possible for Radio Shack,
>since they have NO right to charge for their stenk'in catalogs!
^^

How do you arrive at this conclusion? Of course Radio Shack has a
right to charge for their catalog. They have a right to charge $20
for a 3 ft phone cord, too. While it's possible neither makes good
business sense, they are well within their "rights" to do so.

It's amazing how some people think that if something was offered free
of charge at one time, it must be offered free of charge forevermore.

No, I don't work for RS, and I'm no more enamored of them than I am of
any other business. If paying $2 for a catalog/$2 coupon cuts their
costs, it's no big deal for me since I'll be making a $2 purchase
eventually.

If you're going to go to such effort to stand on principle, select a
principle worthy of that effort. IMO, this ain't worth it.

As I bought a Radio Shack Pro-51 scanner yesterday, the salesguy was trying to show me ho to do this 3-key sequence that if I hold them before I turn it on, it would enable me to do a complete search of ALL the 800 mhz frequencies! He forgot what it was. It was 9-(something)-LOCKOUT. He said a customer saw it in a JULY issue of a scanner magazine. Does anyone know the correct sequence? Any help would be GREATLY appreciated! Any other secrets regarding the pro-51 are also welcomed. Thanks for your time.

Yep, you're missing something. The SS system called IS-95 will use
a SS modulation of 1.25 MHz. At first, only a single such wide channel
would be used for the CDMA SS system. The analog system would be removed
from those channels. Later on, as the proportion of phones shifts
toward CDMA capabile phones, more bandwidth can be converted to SS
use. Note that CDMA SS allows a single 1.25 MHz bandwidth channel
to be used by ALL cells in the system. This is a key aspect of
CDMA's higher capacity than other techniques

I purchased a PRO-51 two weeks ago, took it back and traded for a PRO-43. The PRO-51 received more images than stations, lacked sensitivity, had a horrible squeel when the transmission ended, but before the squelch cut in, and lacked adequate volume. The PRO-51 is ok for the $199, but doesn't match the PRO-43, which solved all of the problems except the lousy sound.

St> rec.radio.cellular, as it has become apparent that while in the days of
(massive snip here)
St> Any thoughts (please, no flames, just sounds like a good idea!)?

Bravo! An excellent idea! Personally I get really frustrated with
the amount of irrelevant stuff I wade thru to get to what I want to
know about.
The whole scanner usenet organization ought to be rethought - seems
there is room for improvement - eg look at all the crossposting between
alt. and rec., not to mention the fido net!
Some logical categories:
1) DX: Frequencies, dx discussions
2) Technical:how-to, theory, how the various systems we monitor work
3) Equipment reviews and modifications
4) Policy and legal
5) Cellular and cordless/baby monitoring

The ham's have already done this, with good results, and the volume of
scanner postings is probably nearly as great as what they generate.
Onwards and upwards!

Paul

From what I've read, the model is being closed out, and/or being recalled
by Radio Shack corporate headquarters, so I don't think any new model
has been created that is non-modifiable. My suggestion would be to
run, not walk, to your nearest Rat Shack and get one before they're gone
for good....

I agree with you 100%. What you got is a law that's unenforceable. Sort of like a law that L.A. County has had for a few months, making it illegal to be on a street corner trying to solicit work (day laborers) in unincorporated areas. The L.A. County DA's office absolutely refuses to even file charges against these day laborers. They just don't have the resources, or even the will, to do it. It's just that the County Board of Supervisors gave in to a rich group of homeowners who claimed the gathering of day laborers lowered their property values.

But here with cell phones, the cell phone industry got these laws passed, claiming it was an invasion of privacy. Then those air-head bureaucrats in Washington agreed, when they suddenly find out that their own cell phones weren't private, as they once thought, so lets make a law. Where have these bone-heads been all their lives? Didn't they realize a cell phone is just a sophisticated two-way radio, and anyone tuned in to the right frequency in the area where one is operating can hear it. Passing laws just won't do a thing about it. There are already millions of scanners and other radio receivers out there that can receive this stuff. Passing a law ain't going to help one bit. I feel absolutely no pitty for the cell phone industry. If they really wanted a reasonably secure cell phone

network, the networks would be 100% digital by now. Instead, they lobby to have laws passed to cover their own mistakes. It's enough to make me throw-up...

Message-ID: <33bt53$igh@nyx10.cs.du.edu>
Source record: 270260

Well, speaking as someone who HAS worked at Radio Shack, here is
what I have found to be true:

1). Older white males are the biggest jerks
2). Many people prefer to be "clerked"(i.e where you give no help)
3). The majority of the customers come in for two reasons:
a) They need the technical help(no, not how to build a multi-ic
circuit, but basica electronics help)
b) They come in for the parts they can't find anywhere else.

Therefore prices tend to be higher. True, they have gotten ridiculous
lately, but you are paying for obscurity and assistance.
4). Radio shack handles catalogs really shittily
5). 10% of people don't want to give out phone #/address. The people that
don't tend to be of mediocre electronic skill. Highily skilled and very
unskilled don't seem to care.Most women don't want to also.
6). Employees have absolutely no say in anything. All Radio Shack
employees are hired on an "at-will" basis, i.e. quit anytime you want,
get fired for anything.
7). People find it incredible that your typical salesman working at
minimum wage doesn't have the same skills as an EE.
8). Ham people tend to be very civil, scanner people don't.
9). Most employees at Radio Shack are NOT trying to rip you off. Nor does
anything you say to them about policy matter in the least. It only
aggravates the employees who would rather not do it in the first place,
and have no choice. The way to get results is to call the District
Manager. Ask any Radio Shack employee for the District Manager's phone #
and explain that you are going to complain about Radio Shack policy and
that person will go out of his way to help you.
10). Radio Shack people react to people. if you are a jerk, chances are,
the salesman will be less than optimal. Be civil and the salesman will go
out of his/her way to help you.
11). For how much they get paid, Radio Shack people are overqualified.

So in summary, people tend to think of Radio Shack people are jerk droids.
Radio Shack people's stereotype of a jerk is:
a). of mediocre skill(but convinced of his/her greatness)
b). older white male
c). always complaining of policy to the employee, but never doing
anything about it or going above the employee to get results

-Layne

btw. while I was working at Radio Shack(1 year) I only sold one computer.
At the time I was(am) proficient in intel asm, c,c++,pascal,dos,unix. The
problem? I couldn't find another job.

I've tried both the tropez and the uniden 9100. From my experience the tropez had problems with a kerchunk type sound when I moved my head. Apparently I may have had a defective unit. I returned it and bought a uniden spread spectrum unit from Walmart for $279. A good deal, I believe.

The range is greater than the tropez and I can clip it to my belt as I walk to my apartment mailbox or trash dumpster (~250 yds). The tropez didn't quite make it to the mailboxes at ~150 yds. The only problem I have with the uniden is a bit of an echo (only at my end) that uniden says is a by-product of the ss technology. I don't know if that's true or not but it is a bit annoying. Also, there are only two volume levels which aren't loud enough for me when my stereo is on. There are some other nice features like intercom, monitor call, hold, etc. It's a good phone. Email me for more info.

As for security, I can't pick it up on my opto freq counter at all. The random counts go up in freq. but nowhere near 900 MHz. That's with the counter only an inch away from the phone! I feel quite secure using this phone for the time being. When spread spectrum receivers get more common I may buy a new phone with encryption.

Can't say much about the other models you mentioned but from what I've heard the at&t unit is the best in terms of clarity. I'd be interested in hearing about range comparisons. Supposedly, the ss system gives greater range and uniden claims the power goes up as distance increases.

It's also on the back of the box. At least it was/is on the one I picked up at a local RS store a couple of days ago (last one in stock!).

It is my understanding, that the way to tell if the PRO-43 is "modifiable", is to look at the FCC ID number on the back of the scanner. If there is an "A" after the FCC ID, it is NOT modifiable. Please correct me if I'm wrong.

The date code on my PRO-43 is 12A3 and it does NOT have the "A" after the FCC ID number.

Someone mentioned to me, that the last date of manufacture of the "non-A" (modifiable) version of the PRO-43 was sometime in April of 1994.

I cannot verify this. I have not tried to modify my PRO-43 and I do not have any immediate plans for doing any modifications to this scanner, and even if I did, I wouldn't tell nobuddy about it :-) ...

I never even bothered doing the mod for the cell phone frequencies on my PRO-2006--listening to other people's telephone conversations is about as exciting (usually) as listening to the MacDonald's Order-Window frequency. There's a whole bunch of VHF/UHF stuff to listen to, as pointed out above, and some of it is actually fun.

I sold my PRO-37 to a friend when I needed money to buy my Yupi
MVT-3100, and got $150, but I was selling to a buddy, and I'm a
sucker! Seriously though, I would think $150 give or take is a fair
price, and if I wasn't on a budget, I'd make you an offer (for all
it's wonderfullnes, the Yupi sucks in 476Mhz (NYPD).

Good luck! I'm all gung-ho for selling on Usenet, I just had a
successful sale of a ton of camera equipment I had lying around that a
local camera shop offered me $300 for, and I sold here for over $900!

Makes me wonder why they'd adopt "You've got questions. We've got answers."
as their official slogan. A Radio Shack salesman once asked me if the
49 MHz walkie-talkies picked up cellular phones. Another tried to tell me
that the antenna wire that came with a small pocket radio was an earphone.
Their slogan should be "You've got money. We've got some stuff here to sell."

: X-acto knive and *carefully* cut the copper trace on the circuit board
: between the CPU and the resistor to restore the skipped 800Mhz freqs. I
: was told that this did the same thing as clipping the resistor, however,
: it wasn't as destructive to the board.

I did exactly this, under the assumption that it would be easier to undo, if ever necessary. It worked fine.

Of course, the scanner increments these freqs by .0125 which results in infrequent exact hits of the .03 steps in use, although reception on the nearest freq the scanner will accept *seems* fine.

I assume there is no way (and probably no real need) to alter the increment... Anybody able to shed any light on this topic?

an rmgroup was supposed to go out 9/23/93, right after
the rec. one was formed. If it did, my sysadmin ignored
it, as did many others, based on the traffic.

There used to be a longer cycle before the same questions
were regurgitated on a.r.s. That no longer seems to hold
true, though. At least it's not as bad as r.r.s... yet.

Can anyone post a listing weekly, specifying brand names,
model numbers, yes/no for triple conversion, and cell modifyable?

Brand Model Triple? Cell-Mod? Notes
Realistic Pro34 X Discontinued
Pro43 X X Only up to a specific serial #
Pro2006 X X *All* 2006's and 2006A's
Bearcat 8500XLT X

and then throw something like

"The ECPA banned casual monitoring of pagers and cellular
telephones back in 1986. The '93 amendment banned manufacture and
import of cellular capable and easily modifyable scanners
after 4/23/94. All remaining stock can be sold until done."

at the end. All that will be left will be people that post
without reading the unexpired articles, and we can't do too
much about them.

Agree/Disagree?

Of course, my favorite is that the PRO-51 is better than the PRO-43 because it scans faster. It also receives just as well or better. The warning is that you should go into the store armed with knowledge of what you want or need.

My biggest gripe is that the stores tend to keep the inventory a tad too low and always seem to be out of things. I hardly ever get to make a trip to the store without either waiting for a shipment or special ordering something. Combine that with the lack of salesman knowledge, I am better off mail ordering from a place like Newark.

Except for portability the Pro-2006 beats the Pro-43 hands down.

1) more memories
2) better audio
3) enhanceability (computer port add-on)
4) I experienced better selectivity, but it may not necessarily be true for
all radios.
5) WFM (if you like listening to TV(VHF band), you need this)

From: hwang@netcom.com
Message-ID: <hwangCuzvrC.43C@netcom.com>
Source record: 270272

I just received my Pro 2006 and was wondering, is the performance of the original antenna really bad? Or is something wrong with my new scanner?

I have been using a Pro 46 with RS's all-band center load antenna and it seems to pull in many more signals than the 2006 with its original whip. I did try the all-band on the 2006 and it seemed to improve, but I didn't do any rigorous testing since the combination was unwieldy with the antenna sticking straight out the back and I didn't have a right angle connector handy at 1am in the morning. :-)

Anyways, I was hoping to draw upon the net-experience to confirm that the stock antenna is crummy, and not that my scanner is defective! :-)

Thanks!

: Yes. It requires everyone to send a message to the administrator of their own
: news site and tell them to remove this group (alt.r.s). As long as people
: keep posting to it, it will live on.

Even *that* will not get rid of the newsgroup. The newsgroup will survive
but your access to it may terminate because it was no longer offered by
your host.

If your concerned about the access time consider that the only difference
would be small amount of time it takes to select the group to read. If
the messages were combined the total bandwith would be the same... hence
the same amount ot time to screen them.

But yes, it does seem to be a waste...

Message-ID: <1994Aug23.160421.20713@iglou.com>
Source record: 270274

A friend of mine just performed the mod on his Pro34 to restore all
of 800 MHz and 66 - 88 MHz by moving the diode from D11 to D9.
After doing this, the 800s are all there, but the lowest it will go
now is around 72 MHz (sorry, I can't remember exactly). Not even
the 30-54 range will work anymore. Is this a side-effect of this
mod, or did he maybe do something wrong, and if so, what?
Any hints will be greatly appreciated.

I tried the uniden at a local store and it does have an annoying echo.
My Tropez is pretty clear and the range is great but I can't compare
the range with any other 900 MHz phone. The salesman I talked to said
the Uniden had greater range. Once in a while, my Tropez won't ring
and I hear my answering machine going off when I get a call. I don't
have my ringer equivelent maxed out so I don't know what the problem
is. Also, the Tropez has an lousy *feature* of polling the base every
10 seconds or so to see if it is out of range. This runs the batteries
down if you leave the phone off the base overnight. Fully charged, I
get about 2 to 2 1/2 hours talk time max. The manual says I should get
4 hours. I'm not extremely happy with mi Tropez but it was a lot
cheaper than the other 900 MHz phones I looked at. I got it for $189.

This has nothing to do with radio, but I'll say it anyway:

I will agree to your death penalty racial quotas
if the various races will agree to murder quotas.
So if blues comprise 20% of the population, we
we will make sure that no more than 20% of the
people executed are blue. This is in return for the
Blue people agreeing to do no more than 20% of the
murders.

>and directly make free thought punishable.

Just remember that posession of internal parts for a firearm silencer
is perfectly legal. Just dont be in possession of a tube too. Concurrent
possession of both is possession of a silencer irrespective of whether
or not they are assembled or even if the tube is a finished tube.

So.....
Got a PC, got a serial port in it, got a scanner? GO TO JAIL

Not only that, but you have to post a bond equal to 10% of the value of the goods in order to be able to sue to get the stuff back. If they take everything including your bank accounts like they do for cases where they THINK drugs are involved, where are you supposed to have cash around to post sucha bond. I think you must post the bond within 2weeks or so. I am a bit fuzzy on the particulars regarding exact procedure and the timing, but is required that a 10% bond be posted.

>to manipulate the media.
>
>Bill

If you don't believe the part about manipulating the media, explain to me how come most Americans believe more people die each year as a result of being shot by an assault weapon than die as a result from a car accident?

here are some stats:

deaths due to firearms of all kinds (including murder, justifiable homicide, suicide accidents) ~25K

deaths to due auto accidents ~50K

deaths due to cirrohis ~25K

deaths due to smoking related illnesses
~400K

deaths due to beestings ~300

deaths due to being shot by assault weapons
~75

-The reason I quote this stuff is that we are being lied to and deceived by a bunch of well meaning crybabies and the media is just going along for the ride. I mean, they wouldn't want to jeopardize their white house press credentials would they?

So don't be so quick to assume the media is our omniprescent guardian of truth, justice and the American Way (tm). These bozos know which side of their bread is buttered and by whom. Do not forget it. Besides they all went to journalism school at Bezerkely in the Peace, Love, Dope '60s (TM) with half of the current administration. They stood in the same lines in the protest rallies and carried the same signs and burned their draft cards together. HEll they probably all bought and sold dope to each other.

Now which side of the political fence do you think they are on?

879. Can I fix this problem? PRO-34

Newsgroup: rec.radio.scanner
Date: 1994-08-24 04:18:05 UTC
From: GRIDE@UCSVAX.UCS.UMASS.EDU
Message-ID: <33ehlt$6fj@nic.umass.edu>
Source record: 270137
Cross-posted to: alt.radio.scanner,rec.radio.scanner

This question is for the serious Radio Shack scanner hacker, or maybe
one of the guys that designed it.

I have a PRO-34 that says it covers like 30-54 MHz in addition to all of the
other fine freq's. It does not. I got it a week ago, secondhand, and I
immediately modded for full 800 MHz. I did not restore 66-88 MHz. I noticed
the next day that I got "Error" when I tried to program in 49.000 for
a limited scan range. I cannot get, manually or automatically, 30-54
MHz to work.

I do not know if it was working when I got it. In an effort to get it to work,
I didn't try 30-54 MHz. I re-opened it today and made the restoration of
66-88MHz, in hopes that replacing the diode would make 30-54 come back.
No dice. I do get Euro radio channel range now (that's what I think 66 to
88 is), but no 30-54.

In short, does anyone know what is wrong w/my scanner? Did I screw it up
(that sucks)? I mean, either way I am stuck with it, but would feel a
little better if I did not dog the thing myself. Let me know if you
are knowledgeable enough to have an insight. Thanks.

Andrew

Just to add a bit to this. It is one thing to be arrested and quite
another to be indicted and convicted. Many cops take the postion (especially
if you look like a sleaze ball to them) of arrest them all and let the
courts sort them out. Just because you are not technically guilty of
a crime such as having fraudulent intent to commit anauthorized access
to a telecommunications service, does not prevent you from being
arrested and your equipment being seized as "evidence".

Just remember that no one is forcing anyone to be a cop. You know the
hazards, you know the working conditions, it is your choice. Do not
expect any compassion or sympathy from me. If you chose to be a
mercenary and wind up being executed (like Daniel Gearhart was in Angola
in 1976), it is not like you did not understand the risks. Cops are a
macho sort by nature, just like soldiers. They get excited by tension
pressure and violence. They are attracted to the job. So don't whine
about the risks etc. It is your choice.

If what you say is true, there should sufficient grounds for kicking this
guy off the force and even putting him in the can for a bit of time.
If he really does smack his wife around and there are witnesses to
back up the story, it seems improbable that he could avoid disciplinary
action. Of course then you would have to live next door to an unemployed
criminal which may make things worse especially if he knew that you had
a role in his ne status. I would advise moving.

: Thanks for reading this, and thanks in advance for your comments.

: Keith KG7EL in Mesa, AZ

I've owned the MR8100 for about 6 months. Generally, I'm not pleased with
it. Too much intermod. Also, I've come to realize that lack of a
search function and only 100 channels are too much of a handicap.
I really do like the alpha display, but the shortcomings really outweigh
the display. My recommendation would to look at another model.

Let me know if you have any other questions

I just telnetted to the Library of Congress.

HR3822 is basically an IRS bill giving tax breaks for the construction of new
marine vessels.

898. Other mods for the BC200XLT

Newsgroup: rec.radio.scanner
Date: 1994-08-24 12:29:11 UTC
From: dbarkley@sun1.iusb.indiana.edu
Message-ID: <Cv1HCo.5D8@sun2.iusb.indiana.edu>
Source record: 270075

Hi everyone,

I've been reading this newsgroup for quite some time now and due to my lack of applicable knowledge I've just picked up a few hints here and there for my scanning adventures. My question to the group is what other mods can be done to my 200XLT? I've restored the full 800 band already. I've seen other modifications for increasing volume, eight hour battery, high speed scan (45CPS), "lite" scan???, and I think something to do with the actual light.

I've tried to download some mod files from one of the FTP sites quite a few times but I can't read them once I have them on my PC. I've tried going back and forth between binary and ascii modes to no avail.

Oh yeah, another thing. I love to use my scanner at the races and I'm looking for a pair of headphones. I can get a decent pair from Racing Electronics for around forty dollars. Can I get a better price elsewhere? Thanx!

Same thing happened to a friend of mine earlier this week. His
definitely *was* getting 30-54 until he did the mod. I asked on
rec.radio.scanner if this was a known side effect of the mod, but
so far I haven't had any answers. I'd also like to know what the
deal is here.

The Bearcat Radio Club in Kettering, OH has a service very close to that. Each state is on a disk with a program to search and list available. The cost is very reasonable to members - I think around $10 per state and $15 for the search program. This program is an R:Base product and R:Base will read the data as well. Also, the club provides a BBS with nationwide info. Membership in the club is about $30 per year with a magazine.

>Even *that* will not get rid of the newsgroup. The newsgroup will survive
>but your access to it may terminate because it was no longer offered by
>your host.

Yes, it will get rid of the newsgroup. A newsgroup only exists on the
different sites. The key is that *everyone* must remove it from their sites.
If only one guy in California has it on his site and one guy in Australia has
it, they will get eachothers messages and might even think that the whole
world is out there also. The same is true now. There are thousands of sites
that don't carry a.r.s but people seem to be content posting to it. One key
issue may be that they have not asked their sites to carry rec.radio.scanner
yet.

A similar thing happened with rec.ham-radio groups. New groups were started
(rec.radio.), but it took about 5 years for people to stop using them. They
are now dead, but probably still exists on a few sites out there. There are
probably people who post to them but never get a reply.

While I have not used the 890, there is no question that the 2006 is a better scanner. The 890 is only double conversion and prone to lots of RF problems.

903. 450.775 Mhz - CNN Audio

Newsgroup: rec.radio.scanner
Date: 1994-08-24 14:05:00 UTC
From: judice@sulaco.enet.dec.com
Message-ID: <33fk2c$51s@nntpd.lkg.dec.com>
Source record: 270159

Found something interesting this week. In Central and Western
Jersey there is always a very strong signal, with carrier on 450.775 Mhz.
Monday night, I heard CNN audio on it. I assumed it was just an image,
but no... Tuning to CNN, the audio was actually ahead of the Cable feed
by about a second. And when CNN segued to commercials, the music played
and faded, but there was no "spot" audio. Last night, from 7:30-8pm,
CROSSFIRE was on 450.775, but the CNN network was carrying OJ Simpson
hearings. At 8pm, the news anchor said that CROSSFIRE would be delayed
until 8:30 - when it did play, a repeat of the audio I heard at 7:30.

During Larry King, you could hear "setup talk" and the director
checking with Larry and the other guests about their audio.

Well, obviously this is some kind of studio-remote link, but what is
odd is that it is not in 100% synch with the network, implying that
there is some other audio feed (not off the satellite) that is being used
to source the signal.

BTW, the signal often has NO audio, just a carrier.

If you are talking about the tube-shaped one with a tunable notch filter...

I had one on my R7000 for a few days and returned it. The attenuation was not sufficient to improve the situation.

>-Brian Baude

If you restore 66-88 you loose 30-54. Hopefully if you read my mod
that follows, you'll discover what went wrong...

Pro34 Mods

Remove the four screws from the back of the unit, then remove the batteries. Gently remove the back cover from the unit. You will need to de-solder the antenna from the top board. Then remove the nuts holding the squelch and volume pots. There may be a wire at the other end of the top board to de-solder, which I think is mainly for grounding purposes. Then, there are four hex screws holding the top board on. Remove these and carefully wiggle the top board loose from the bottom. I say wiggle because there is a multi pin connector to unhook. Once unplugged, slide it out horizontally so that the volume and squelch pots slide out with the board. Then there are three screws to remove to lift the metal shielding from the bottom board. Once you have the bottom board in plain view, you should see D9, D10, D11 and D12 on one side of the board. Cut one lead of D11 and seperate the leads so they dont touch. This removes D11 from the circuit and adds the 800 mhz cellular phone bands to your scanner. It is a hassle to get to D11, but the added frequencies are worth it in my opinion. Of course, LISTENING TO CELLULAR PHONE CALLS IS ILLEGAL! There are other mods that do various things to the diodes but these mods are of little value. One, for instance, adds the 66-88 Mhz band but it also removes the 30-54 Mhz band at the same time. In addition, many units won't even pick up anything in the 66-88 band without major realignment. I know mine won't! There is one other mod that's worth doing. I can't

remember the part designation, but there is a ceramic 2 Mhz crystal on the logic board (probably blue in color), near the main CPU You can replace it with a 3.4, 3.55 or similar value for increased scanning speed. If you go over 4 Mhz, your CPU *may* not be able to maintain its integrity. If you use a normal crystal, you'll have to bend the leads over and lay the crystal flat over a nearby chip. It will fit though and it works! Make sure the crystal leads and the crystal body are insulated from touching any other circuits. If you use the two second delay, it will be affected by the crystal. The delay time will be reduced by increasing the crystal frequency. When you put the unit back together, make sure the key lock switch is intact. Mine fell out and I didn't notice it was missing until I had everything back together. Also, don't get the antenna connection too awful hot. There is a surface mount cap near the underside that will fall off if you apply too much heat. This is the input cap from the antenna. You'll notice decreased signal strength after you put it all together again. It can be a real bear trying to put surface mounted parts back on the board!! Trust me ;-)

Have fun. If you really screw up your radio, it's NOT MY FAULT !!!!!!

The header confuses me about who wrote what, but this was my experience. I wanted a handheld I could lock in my desk at my office so I tried the 51. While it wasn't *quite* as bad as AB's, I returned mine (even though it meant eating a restocking fee; so sure was I that I bought it through a discounter) and got another 43. If it should turn out that the 62 comes out in the next few weeks and is not as secure as the ECPA would like, I may consider a switch to save $50 (the 62 is also a triple conversion unit), but I'm happy with the 43.

909. Icom R-7100s in Canada?

Newsgroup: rec.radio.scanner
Date: 1994-08-24 15:45:42 UTC
From: kmorrill@strauss.udel.edu
Message-ID: <33fpv6$ppb@strauss.udel.edu>
Source record: 270165

What are the differences between the Icom R-7100s available in
Canada and the Icom R-7100s that used to be available in the U.S.?

What are the chances of finding a full-coverage Icom R-7100 in
an electronics store in the U.S.?

I know that the large mail-order firms have stopped selling them
to ordinary citizens.

Is a store-to-store local search the way to go to get one, or is
ordering from abroad the best hope?

If ordering from abroad is the best way, what is different about the
radio (regarding power supply and anything else)?

Thanks.

>been accidentally switched on!

Nope, first thing I checked. I played around with it some more last night and my Pro-46 definitely out performs the Pro 2006 in the cordless frequency range. The 46 was able to pick up weaker signals and with less noise. This was done with both scanners side-by-side and swapping antennas back and forth.

Has anyone else ever received a 2006 DOA?

Someone once told me that it was possible to have a cellular phone
scan different channels/freqs. so that you could listen to them.
I have a motorola 550 cellular phone and was curious if it is possible?
and if someone knew how.

: >had with its VHF-Air reception), or merely a problem with only a few early
: >models?

: According to the posts on CI$, there is a simple fix involving the addition of
: a common diode. They are still waiting to see if the next round of production
: models have the fix or not.

: >I really want to get one of these beasts, but am hesitant to take the plunge
: >if the unit is buggy. BTW, what's the going price on avg. these days?

: Grove wants $649 for the US version. Javiation's price is 395P for the UK
: version which is about $600. There is also a $40 duty when the unit is
: imported.

What, grove is selling the international model with FULL 800mhz?

I think it should be noted that the Grove model will be a waste
of money in that it will be the US version without the cellular
frequencies.

On the other hand, you can get it for $10 cheaper from Javiation
and have FULL COVERAGE.

I do not think the choice is hard to make!

Reminder: This thread is an open-ended political discussion, not an article about shortwave radio. Please don't cross-post this thread to rec.radio.shortwave anymore.

If you are unfamiliar with such things as editing headers to avoid cross-posts, I recommend that you read messages in news.announce.newusers. Cross-posting to many newsgroups is generally frowned upon because it leads to numerous followups that aren't relevant to every newsgroup the message was originally posted to.

Cross-posting from groups in the "talk.*" hierarchy is to be avoided in particular. That hierarchy exists for discussion of topics that are known to generate long and voluminous threads. Folks interested in those threads can subscribe to those newsgroups; folks not interested in those threads shouldn't need to wade through them when they're cross-posted to other newsgroups.

919. Opto 456 for Other scanners?

Newsgroup: rec.radio.scanner
Date: 1994-08-24 17:10:15 UTC
From: steven@sgb.oau.org
Message-ID: <Cv1uD4.9Mp@sgb.oau.org>
Source record: 270080

Since the life of the 2006 is almost over and the 2005 is over, is Opto Electronics going to re-work the Opto456 to permit adding it to other Radio Shack scanners that are in active production?

It would be the ideal solution to the cellular blocked problem -- since for a Base scanner, I have no objection to overriding the factory CPU block with an electronic hardware add-on, computer driven to get around it, as I do not normally carry base units around, and my computer room is also my radio room!

Let's hear it.. We want an Opto 456 for some current production units right?

What is Opto's number and I'll call them to find out!

GMRS is regulated under Part 95. It appears to be a regulated, licensed citizen band type of service. 95 still allows businesses to operate GMR systems, but I heard a rumor a while back that business may get forced off someday. Communications are limited to the persons defined as eligible under your license - in the case of a system licensed to an individual it would be immediate family members.

GMRS operations are limited to a maximum of 50 watts. Licenses may limit power to 5 watts when north of "Line A", or 15 watts in urban areas. Small base stations are limited to 5 watts ERP. The license limits the coverage area.

The are eight channels in the GMRS starting at 462.550 in 25KHz steps to 462.725. Mobile relay stations may be paired with 467.xxx frequencies but no direct communications (not through a mobile relay) are permited on 467. Licenses are issued for specific channels.

There are also seven low power, splinter channels for simplex only, voice operations at a max of 5 watts. They are between the regular channels (ex: 462.5625).

I don't hear too much about personal use of GMRS anymore. Is there anyone using it for "family" communications?

>back up the story, it seems improbable that he could avoid disciplinary
>action. Of course then you would have to live next door to an unemployed
>criminal which may make things worse especially if he knew that you had
>a role in his ne status.

I live in a small town that has almost rediculous standards for cops.
Some have never been to the state trooper academy (which they must do).
Some do nothing but write tickets. One cop, who was just promoted, won't
make a traffic stop on an adult without backup, but will harass a kid at
the drop of a hat. He also won't go check out buildings with an open door
reported - one time he said his battery fell out of his
radio!!!!!!!!!!!???????????

We already have a bad drug problem downtown and its moving this way. The
cheif is an idiot (I know him). If the criminals from the big city find
this out, we'll all be in a lot of trouble

>I would advise moving.

If I could afford to I would. He is also trigger-happy. Scarry, isn't
it?

The 2006 is supposedly less sensitive than the
handhelds or mobiles that RS sells. The thinking
is that it will likely be hooked up to a bigger
antenna and so you don't want it to overload on
signal. The 2026 (?) mobile is much more sensitive,
but I assume that it could overload if hooked up
to a large stationary antenna.

There is a PRSG (Personal Radio Sterring Group) in Ann Arbor, Michigan working on GMRS issues. There phone number is (313)-662-4533. You can get a FCC GMRS license application form and pay a fee (it used to be $35 for 5 years) to receive a call sign (I am still waiting for mine). I believe the maximum transmition power is 50 watts. The GMRS frequence range is between 462.55 - 467.55 MHZ. I also heard that there are GMRS repeaters nationwide but are far less than that of the 2M or 70CM. If you purchase a GMRS radio, make sure that it can handle the repeater operation in your area (frequency split at 5 MHZ).

I am still shopping for a handheld GMRS radio.

What you're hearing is an IFB feed that the network uses to cue talent and such. Since there is a delay on the satellite and they need to be able to cue talent, people being interviewed, etc, they use a 450 or 455 frequency to send those feeds. Often you'll hear standard audio (pre-delay if they're using one) and director cues on top of the audio. Most television stations use this (frequencies are also in use by radio stations).

Sean

^^^^^^^^^^^^^^^^^^^^^^^^^^

Yep... Interesting link here too.

A couple of years ago, a former cop of a local police department in Contra Costa County (Ca) was staking out a resturant with a partner (non cop partner) for three nights in preparation for an armed robbery.

The ex-cop sat in a car across the street while his partner hid in the bushes outside the resturant. The two kept in touch with each other via two way radio on 154.6 mhz and for those three nights, exchanged idle chit chat and bragging to kill the time (no one ever said crooks were smart.) The ex-cop also had a hand hald scanner in his vehicle and was monitoring the local police.

On the third night, they carried through on their attempt.

About two blocks away, a scanner monitor was listening to this chit-chat for the previous two nights. It was readily apparent that this was some sort of stakeout, but the criminal intent was unknown to the scanner listener.

Being that some of the bragging being monitored consisted of the person in the vehicle talking about times he had worked with the DEA on stakeout and other such police experiences, the scanner listener opted not to inform the local police of the radio intercept (even though it was apparent that they didn't want to meet up with the local police) in the off chance that some big federal type of stakeout might be screwed up... instead, the scanner monitor continued to listen from the confines of his own apartment, and with a pair of binoculars, confirmed the location being staked out by noting movements around the place as reported over the two way by the two suspects.

About 11pm or so on that Saturday evening, the scanner monitor noticed no further communication on the frequency. Nothing really different than the previous two nights... The observers probably just packed up again for the night.

About 1am or so, while monitoring the police frequencies, the scanner monitor hears a police call about a man tied up on the

corner outside the resturant. At that point, (although probably illegal under the Communications Act of 1934) the scanner listener called the police dispatch to report possible information on the crime.

A police Sergent called him back a bit later, listened to some of the info and then with a "don't call us, we'll call you" type of attitude, hung up... probably saying "Nut Case" to his partner.

About an hour later, the same Sergent calls back, this time with a completely different attitude and asks if he could send over one of his corporals to interview the scanner monitor.

Two days later, they had two suspects in custody. The Ex-cop plead No Contest (after a first trial with a hung jury) while the second suspect was found not guilty. The second suspect however was found guilty in another armed robbery in which the ex-cop was found not-guilty. Both were also suspects in many other cases. All of which came to light after the three night radio stakeout robbery.

Side Note: Just two months ago (the above was many years ago) the ex-cop's brother, and the second suspect were convinced to roll over and rat on the ex-cop and his former Captain for a murder which was linked to them at the time of the trial for the resturant robbery. Allegedly, the fatal bullet was fired by the second suspect, but in exchange for ratting, he will be charged with something lighter than murder. (This has yet to go to trial)

Back to the Above...

Q1. If scanners were outlawed, would the robbers still have been using one? (IMO, probably so)

Q2. If scanners were outlawed, would the scanner monitor have had one, or if he did, admitted to the police that he did and reported the information on the crime? (IMO, probably not)

Q3. Did the scanner monitor in any way, interfere with what was suspected to be an official police stakeout? (IMO, No)

Q4. Can you think of an appropriate analogy to the old NRA phrase of "When guns are outlawed, only outlaws will have guns?"

No, I suspect that Mr. Reserve Officer will claim something like: "Yeah, But this scanner listener is not like all of them. Others might interfere and [so to speak} chase the ambulance."

True, BUT, then again, there are those citizens who are not so equiped with scanners who will also gravitate in the direction of a siren "just to watch." I'd suspect that there might in fact be more (percentage wise) than scanner listeners (reporters and lawyers not included) since the scanner listener *can* observe the events from the safety of his/her

own home.

FWIW, Back at the time this happened, I was speaking to the Corporal who was in charge of the investigation about the concerns they might have over folks listening to them on the scanner. Corporal Sloan had responded saying that they have no problem with it as long as folks don't ambulance chase. It was pointed out that the Neighborhood Watch also encourages the use of scanners by the citizens.

IMO, any police officer or department that whines about how folks don't want to get involved (ie: No sir, I didn't see anything) has no right to complain when decent folks "care" about the duties of their local law enforcement officials enough to listen and hear what they are up against.

In the above case, the scanner monitor has exposed himself to the possibility of civil liability (maybe defensable?) just for relaying the information heard to the cop without such influence as a court order.

YOU CANNOT LUMP ALL SCANNER LISTENERS INTO A SINGLE CATEGORY OF CHASER!!!

... And cops wonder why citizens have no respect for them.

Somebody was kind enough to respond to my questions about GMRS, and I thank you. One of the responses was an organization that helps with licensing. Could whomever responded with that info please do it again? I was in the processing of saving the post, and something crashed.

Thanks in advance

James Holtzman kc6ncg (holtzman@shazam.ecs.csus.edu)

Not quite. I cancelled mine, but I still receive their catalogs, and I just got a free issue of their new rag, *Satellite Times*, both with labels clearly descended from my old MT subscription.

Maybe if I had one of those old jamming transmitters from the Soviet Union.... :-)

Does anyone know of any advantage to using the Icom CT-17
interface over the J-Com interface cables ?? Does the Icom
pass the S-meter signal or anything else that the J-Com
will ignore ?

Thanks in advance for your comments.

Hello!

I don't know if anyone out there has seen or used SCANMAN, but it's a large, shareware, searchable, indexed text file glued into an .EXE engine that lists frequencies for most of So. California. I just downloaded a more recent version (v11.00) from a local BBS, and it looks great except there is no information for the local police (Torrance, CA). From what I've seen, he only has a So. CA version, but maybe some people can get together and write up versions for other areas?

This version apparently was expanded and broken into two parts: Government and non-government listings. It even has listings for those coveted McDonalds Frequencies! :-)

Anyhow, I downloaded it from the Bad Boy's BBS at (310) 378-3081; filename SCANM11.ZIP. The author is Brian Petersen, 1415 N. Aldenville Ave, Covina, CA 91722-1523, and he ask's $20 for the registration and $5 per issue for updates. I'm not connected with the gentleman at all; just like what he's done. I haven't seen it (or looked for it) on an FTP site yet.

Actually, I did that. It made a different too. One police officer in
Lindenhurst, Illinois, took to running the license plates of all
vehicles in our drive way (for no legitimate police purpose), and
when I was discussing it with their boss (the village mayor), he asked
how I knew the officer was doing that... when I said I heard it on the
scanner, the Mayor said, "well, that will stop," and it did.

Anyways, I suspect hollywood.cinenet.net is much better than alt.2600...
so, keep having fun.

Hello,
I just purchased a PRO 43 scanner from the Shack. Subject says it all. What do I need to check to see if I can modify the unit, and how do I go about by doing it? Any keyboard mods as well?

Also, why would the Shack make it so easy to access the 800Mhz "restricted" bands on the '51 by a keyboard "password" ?

Thanks In Advance,
-Chris

What frequency guide to use sort of depends on where you live and whether or not you have a computer.

If you live in the northeast, Scanner Master wins, hands down. As another poster said, there may be a freq or two missing, but that's more than made up for by the codes, maps, station locations, alarm assignments, system notes, etc., etc.

I've never seen a Scanner Master other than the NYC/Metro, Mass and NE versions so I won't pretend to know what they're like (but I bet they're as good :).

If you don't have a local Scanner Master, Police Call is the way to go. Info other than freq-call sign-TX location is a little thin, but that is made up for by the volume. They also publish a Special Edition for SoCal that sounds more like Scanner Master (tho' I've never seen it).

Monitor America is great for travelling. I don't think I would rely on it as my primary source for my place of residence though. Of course, it's *supposed* to be a traveller's guide - why else would they include all fifty states! I hadn't noticed the lack of cross-referencing, but now that you mention it . . .

Now, if you have a computer, especially one with a CD-ROM, everything is different. With a CD you can look at all the info, sort it, create your own listings, etc. I have just the Arkansas file (20 Mb) and it's great! It even shows what direction the directional antennas of some systems point and how many dB gain they have . . .

<shameless plug>

Of course, if you want really up-to-date info, you should join the Radio Communications Monitoring Association. The RCMA publishes _Scanner Journal_, a monthly, 40+ page newsmagazine for monitoring enthusiasts. Dues are US$24/yr.

<shamelss plug off>

Oh yeah! Almost forgot, except for the CDs, which in PerCon's case come straight from FCC (PerCon is the Official Supplier or something), all the above mentioned sources welcome customer input. If you don't think Police Call has enough info, send Gene Hughes the corrections. Same for Barnett's Scanner Master/Monitor America.

>where the cars are physically with it?

They have "MDT" here in Portland Oregon...

MDT = Mobile Data Terminal

I believe that when the system is running properly that the MDT can transmit/recieve queries about suspects/vehicles and can transmit/recieve messages from the station and possibly car to car...

That's all I know...

Take Easy

orion1@iastate.edu (Alex O Leu) writes:

I never used to pay any attention to the gun nuts. I figured, Why does anyone really need a gun? As I learned more about the US Constitution, I began to realize that the 2nd Amendment has less to do with blowing ferocious deer into oblivion and more to do with keeping the government in line.

I also used to snicker at "Guns don't kill people, people kill people."

Now I pay a little more attention to the gun nuts (most of whom *are* nutty, IMHO) and I don't snicker any more.

>I have been involved in several calls in which scanners have caused very
>serious problems.

Them scanners is dangerous, all right.

> We had a situation where the was a man with a gun and
>several scanner listeners came out to see what was going on. Many people
>could have been hurt.

They did so at their own risk. And they, of all the bystanders, knew what risks existed.

> We also have a problem with kids vandalizing and
>stealing items. They all carry scanners and it makes it very tough to get
>backup on a situation when they know when it is coming.

Every jurisdiction has problems "with kids vandalizing and stealing items". Many states have laws increasing penalties when a scanner is used in the commision of a crime. Punish the ones committing the crime, not Joe Squelch, law-abiding scanner owner.

> I feel that you
>think that scanner listeners are primarily good and helpful. Well, you are
>wrong.

Has it ever occured to you that for every person you describe above, that there are probably a hundred or a thousand that are sitting at home or in their cars just listening.

(I myself pay particular attention to the BOLOs while I'm driving around so that if I see the suspect, I can report him to the PD or SO. Hasn't happened yet, but I think of it as almost a duty, so I keep listening.)

>I am one who could care less if people have scanners in there homes as long
>as they stay away from the scene.

If they interfere with your job, arrest them. You know, Police work is
only easy in a Police state.

>know I am one. I ask everyone to be more tolerant because until they have a
>life placed in jeoprady or a case botched because of a scanner, you can
>never understand.

Actually, the majority of scanner enthusiasts understand very well what
Law Enforcement goes through. Why do you think we listen?

>you are a cop and in the situations they encounter then I recommend you just
>quiet down. I feel sorry that you have such a poor opinions of cops,

With statements like "just quiet down" is it any wonder that some resent
the Police?

I have a J-Com cable I use with my R-7100. It works great and I have no problems with it. The only advantage that I am aware of is that the CT-17 has multiple ports on it's case so you can interface (& control) more than one CT-17 compatible radio simultaniously. I don't know if the J-Com can support more than one radio (if you daisy chain via a box you build yourself).

BTW J-Com sold out to Ramsey Electronics (the big kit electronics company) so all the radio interface cables are actually sold by Ramsey.

PH>>i have a ar2500 which dose fine at 800megs and fair from 88 to 174 meg
PH>>however from 1-30 it sucks an from 200-400 ive never loged one thing
PH>>also a freind of mine has the same radio and fells the same way the
PH>>radio has no sensitivity ... ive also got a bc200xlt and a icom r71a
which
PH>>the aor can not hold a candle to ive also sent my aor back to the
factory

PH>>because of this they religned it and checked the sentivity on it but
the
PH>>bottom line they said was this is what you get

PH>Don't expect good performance below 30 Mhz from a unit mainly designed
PH>for VHF and UHF.

PH>As for 200-400 Mhz this is mainly military aircraft using AM. Because
PH>of the size of this band it may be hard to get anything just be searching.
PH>A better way is to obtain some exact frequencies used by a nearby airforce
PH>base and program these in.

Per,
I have also messed around with AOR scanners and overall the
money is better spent on another product line I've had a 2800.,
2500, and finally settled on a 1500. The shielding on the units
is CRAP! the intermod and overload are REALLY bad in any sort
of urban area, the shortwave section I rarely use and I also
have never been able to monitor any of the Mil frequencies (I
live about 10 NM from Andrews AFB).

My 2006 is more sensitive than my pro-43 when both side by side with
stock antennaes. The 2006 has a attenuator switch on back for when
you hook up a outdoor antenna.

There are 21 control channels on both the A and B side carriers. Is this what you are looking for? If so, channels 313 - 333 are the "A" system control channels. Channels 334 - 355 are the control channels for the "B" system. As to the channels assigned to the specific sector, that is another story. It normally going to follow a standard, such as every 21 channels.

956. handicnt.zip - Optoelectronic 3000A & M1 handicounter reviews

Newsgroup: rec.radio.scanner
Date: 1994-08-25 02:41:56 UTC
From: bmork@opus-ovh.spk.wa.us
Message-ID: <9408250241.kp9000@SimTel.Coast.NET>
Source record: 270107
Cross-posted to: comp.archives.msdos.announce,sci.electronics,rec.radio.scanner,rec.radio.amateur.homebrew

I have uploaded to the SimTel Software Repository (available by anonymous
ftp from the primary mirror site OAK.Oakland.Edu and its mirrors):

SimTel/misc/hamradio/
handicnt.zip Optoelectronic 3000A & M1 handicounter reviews

handicnt.zip contains two text documents, reviewing Optoelectronic's
3000A and M1 handicounters, capable of time domain measurements on
directly coupled and RF signals up to the gigahertz range. These have
attained leading market position and are advertised in most Amateur
Radio/electronic magazines. I have owned both of these meters and after
running them them through the ringer, summarized my findings in these
technically accurate reports, unbiased by advertisement dollars. Other
users and possible owners will be interested in what they can - and
can't - do.

Alex O Leu (orion1@iastate.edu) wrote:

{deletia}

: I am one who could care less if people have scanners in there homes as long
: as they stay away from the scene.

I will operate a scanner wherever the hell I chose to. If your department
is so stupid as to communicate "in the clear" I will listen, if it causes
interest, I WILL GO SEE.

: And yes I have been assisted by scanner listeners on more than one occasion.
: And yes I appreciate the help as long as they stay out of the way.

SEE ABOVE.

: The reason cops get an "attitude" is because they get tired of people
: sticking there nose into situations where they just cause more problems. I
: know I am one. I ask everyone to be more tolerant because until they have a
: life placed in jeoprady or a case botched because of a scanner, you can
: never understand.

Botched by a scanner ? What a foolish statement. Botched by a stupid
department who figures that "the public" has no right to listen, and act
on the information obtained.

{deletia}

: It sounds to me like you have a bad attitude. Give them a break. Unless
: you are a cop and in the situations they encounter then I recommend you just
: quiet down. I feel sorry that you have such a poor opinions of cops,
: because without them we would all be in a world of hurt. You are right law
: enforcement isn't like on TV. It is 90% boredom and 10% terror, but
: remember that 10% may be the ultimate scarifice(i.e. his/her life).

Don't expect to "get a break" from scanner users. They are
excercising their right to listen, and their right to go see what
interests them.

The ONLY way you will "get a break" is if your department is savvy enough
to go to encrypted signals. No, I'm not talking about the silly "voice
scramblers" sold by Motorola and GE, I'm talking about the use of proper
technology for private communications. Like 64 kilobit spread spectrum ,
and the data stream encrypted with a decent DES algorithm.

Yes, it costs more, but, it is THE ONLY WAY to ensure privacy in
radio communications. Otherwise you're kidding yourselves by thinking
that this world we live in is occupied by kind benevolent people.

(scenario mode on)

Gosh, Captain, they listen to us, but maybe if we ask nice, they won't
come to the address that we just announced to 20 thousand listeners...

(scenario mode off)

{deletia}

: I can
: tell you do not know much about cops because there is no such thing as a cop
: without an attitude, trust me I have been around quite a few more than you
: have. Before you go running your fingers off, I ask that you try to think
: because you are just going to make it worse for yourself in the long run.

As much as I personally appreciate what one cop did for me once, you blew
it here.

When all else fails THREATEN.

So tell us, really, how can he "make it worse" for himself ? Will
you look him up and give him the Rodney King treatment ? Put his
name and address into the FBI computers as a "suspect" ? Maybe he has
a bad attitude, maybe some cop with "an attitude" met him once or twice.

I don't give a damn about your or his attitude. Just your communications.
I believe that is what this group is about.

If cops continue to use STUPID communications, like old fashioned
narrowband FM, transmitted in the clear, then I figure that they will
continue to deal with somebody hearing it and "getting in the way".

Dean

(a professional communications engineer, with no patience for the absurd)

BTW, yes I'm rude. See me if you really do want privacy in radio
communications. I can see to it that NO ONE unauthorized will recieve you.

Are you kidding?
GMRS personal users are hitting the air in an ever increasing rate especially in urban areas.
If you will notice in the near future....If us community repeater system operator don't watch it, it may turn into the dreaded cb of the future.

Already I am investing into a Connect Systems TP-154 PLUS in anticipation of the proplem users. I will be switching over to DCS tone as soon as the box is opened.

"...but are far less of 2m or 70cm..."

Most GMR system repeaters here in Cincinnati have equal the coverage
of most commercial business radio systems.

Coverage extends far out into the fringe suburbs and in to surrounding
Dayton Ohio. My system has good saturation for about 40 to 50 miles
with a good share of noisey spots of course.

Granted 148 mhz systems reach farther, but don't make serious interested
individuals think that GMR is just an over glorified "Backyard Communications
Device". The users on my system never have asked me for wider coverage
so I can safely assume that families today can rely on GMR for their
communications just as long as we can keep tight control of our repeater
system from potential abuse. (Something that also occurs on Ham bands too)

I have heard OF one exchange one time, I can't remember how it started, but two cruisers with two officers each were going to a residence on the local reservation for a dispute.

Telecom: "<complainant> wants you to return to the scene."

Officer: "Well, we keep on going back and they refuse to talk to us. Tell them we will NOT be coming back today.. and we'll go down there in a few minutes."

Telecom: ".... <officer>, we believe they have a scanner."

Officer: "Oooooook, well, tell them we're coming, then!"

My understanding was that satellite times was a new publication, however when my 'sample' issue came the mailing label had a 1995 expiration date and I had not subscribed (nor do I have any interest to). Perhaps they just ran another batch of monitoring times labels, but it does not seem to be clear what they are doing.

Caution on posting scanner mods here.

FCC FINES CAN REALLY HURT - The FCC has been known to hand out some pretty stiff fines for infractions of the rules. Recently, the FCC San Juan, Puerto Rico, office issued a fine of $7,000 to NP4VG for willful interference to another amateur station. NP4VG was operating an otherwise legal repeater which interfered with the WP4CNU repeater, which was a coordinated repeater (NP4VG's was not). In another action, the FCC fined Ace Communications of Fishers, Indiana, $20,000 for marketing illegal scanner radios (cellular phone capable). Ads for the scanner ran in 73, CQ and Popular Electronics.

Good stats, but here's a real kicker I came across from a Univ of Ill
researcher (report out about 4 months ago). Guns were three times more
likely to be used in the prevention of a crime than assisting one.
Make guns illegal and the good guys won't have them. Guess what the
same survey will show in a few years? *Of course* a lesser percentage
will be used to deter crime!

If the results are wrong, ignore them and make a law to stack the deck
better the next time around!

The researcher that wrote this report went through a heart-wrenching
realization (he self-proclaimed that he wanted results the other way,
since he wanted to restrict guns). His conclusion was welcome:

Rather than make some guns illegal for all people, make all guns illegal
for some people (convicted users).

What do you need to know? I took the test, and since then, have become
a regional examiner for one of the FCC contract testers. There are
several competing testing agencies. The most well known, that I know
you could easily get hold, I have a bad attitude toward, so I'll skip
those specifics (sorry).

I could get you names, addresses, and phone #'s for all the testers
if that's what you need.

The confusion of ad copy vs editorial boundary is a common theme in
Grove's other publication, MT. I personally get pretty turned off
by this. I wish Bob would either be a publisher or an equipment
dealer, but not both.

I also think the ST magazine is a nice idea, the first issue has
good information in it, but I wonder if they can sustain it
with quality info or if it will become a big infomercial for the
stuff Bob is out to sell....

Source record: 270026

domonkos@access.digex.net (Andy Domonkos) writes:

>Can anyone hwo has experience w/the tow of these scanner please share
>your findings? Thanks.

Ok, I have a 890XLT, and a friend here at work has a 2006.

Both are very good scanners but here are the key Differences:

o The 2006 is pretty much every frequency between 29mhz and 1.3ghz
while the 890XLT is missing Broadcast FM, and the TV Bands and only
goes up to about 950mhz. (both miss the cellular phone frequencies)
The official list for the 2006 is:
25mhz to 520mhz
760mhz to 1.3ghz (-cell frequencies)
AM,Narrow FM, and Wide FM selectable on all frequencies, but
defaults to the expected modulation. Seperations of 5khz, 12.5khz,
and 50khz are available.
The 890XLT is:
29mhz to 54mhz (NFM)
108mhz to 136.975 mhz (AM)
137mhz to 174mhz (NFG)
216mhz to 224.9875mhz (NFM)
225mhz to 399.9875mhz (AM)
400mhz to 512mhz (NFM)
806mhz to 956mhz (NFM) (-cell frequencies)
AM and NFM are not selectable. Seperations of 5khz, 12.5khz, and
25khz are avaiable.
o The 890XLT is a 200 channel scanner while the 2006 is a 400 channel
scanner. Both are 10 banks (i.e. 20 / bank and 40 / bank respectfully)
o I got my 890XLT for right at $300, he got his 2006 for $450 (but it is
now around $400).
o The 890XLT will scan at 100 ch/sec, while the 2006 is like 30 or so per
second.
o The 890XLT has a "Count" mode where it will display the number of times
a channel has broken sequelch. This is good for putting in a bunch of
frequencies and letting it scan them, then comming back to determine
which ones are really active.
o The 890XLT can only search up, while the 2006 can search up and down.
Both have limits on the search range.
o The 2006 seems to have a better grip on avoiding echos from other
frequencies, but on the other hand, both of us share the same rooftop
antenna, and I can pick up somethings he cant.
o The controls on the 890XLT are a little bigger than the 2006, which
means easier finding them in the dark (like when you listen from home

while you are going to sleep). There are fewer controls on the 890XLT
but the functionality is still there.
o The 890XLT has a WX button that searches the weather channels.
o The 2006 can set delays on individual channels. The 890XLT is all or
nothing.

So to sum it up, both are very good, but for about $100 less, you loose 200
channels, a hand few of frequencies, but you gain 100cps scanning, and a
pretty cool looking box.

Hope this helps!

From: jpotts@sad.hp.com
Message-ID: <33i669$ip6@hpscit.sc.hp.com>
Source record: 270025

I just purchased a BC220XLT scanner. It appears to have a birdie right next to the local police frequency I listen to on a very regular basis. The frequency of the birdie is 154.105 MHz. The frequency I am interested in listening to is 154.100MHz. I know that I can tune to 153.995MHz to listen to the police but that is not what I want. Does anybody know if all of the BC220's have this same birdie.

I have the Pro-51 and am very pleased w/it. I live 25 miles North of Baltimore
and the image problem isn't too bad except on 800 Mhz. The sensitivity is
superb and the audio is excellent. It is possible that the unit w/the squeal
was defective. I was tossing around the idea of trading in the Pro-51 for the
43 also but the keyboard mod and Hyperspeed scan feature are nice features.
I would not put an external antenna on this unit other than something like
the Comet's RH77BC (14 inch multiband rubber duck).

Andy

I remember the post but didn't save it since it was before I picked up my
unit; so much for 'hind sight'.

Some handheld will outperform base units on sensitivity w/stock antennas.
The base units are optimized for use w/external multiband antennas, hand
helds are not. I just pick up the 2006 yesterday and I'll check it against
my handheld. It is possible the 2006 may lack sensitivity on some bands
w/respect to others. Don't return it yet...

the Icom CT17 is a nice box but is overpriced. It is really nothing
more than a level converter based on the MAX232 chip and its compatibles.

It is necessary to use one of the unused pins to pass the squelch break
signal from the R7000 to the box if you want to bring it into the
radio.

There is only a single signal coming from the radio to the ct17 and
it has a ground wire with it. My understanding is that the R7100
has a means for reading the s-meter, but I have not verified with mine.
I also understand that the R7000 and R71A do not support the s-meter
being read via the port. SO it is really a matter of the receiver
multiplexing the s-meter onto the signal wire rather than the
level converter offering or not offering S-meter support.

I hope you are successful with yoour project.

>Can anyone hwo has experience w/the tow of these scanner please share
>your findings? Thanks.

Andy -

Rob gave a very good list of differences between the two scanners, but he forgot to mention one very handy feature on the 890 that is not present on the 2006. That is, the capability of the 890 to automaticallly load active frequencies into specified memory banks. You can start out with empty memory banks, leave the radio on all night, and end up with most (if not all) of the banks filled with frequencies that were active during the night.

Unfortunately, many of those frequencies will be images of other frequencies. The 890 seems to be quite sensitive to imaging (cross-modulation), and I would -not- recommend it for a listener living near a cellular transmitter or in an RF-noisy environment.

Not sure either Mark, my label has a 1993 expiration date. I haven't renewed my MT subscription
since then, so maybe they just used the MT database to print the mailing lables.

As far as secured communications go, my local PD has started using SSB CB radios. They will say over VHF, "Go to your sideband radio" and use that for "private" communciations.

BTW, I am waiting for a scanning HF receiver that will let me discover the freq they are using and listen in.

Here in France the GSM system is very very inexpensive. In fact
some store sell one to you for FREE (but you have to subscribe for one
year to a telephone company). Also they are two operators of the GSM in
France (a third one is expected for soon!) so the competition between
them is very hard and the price decrease a lot. For example in the
beginning of the GSM (3 years ago) a such device cost 6000 FF (1 US$
for 6 FF) now you can find some at less than 1000 FF. It's totally
crazy (especially for scanner listenner). Moreover the GSM system is
scrambled so there is no {easy} way to listen them.
So I am very surprised to learn that in the US the digital
cellphones are so expensive.

Thanks to a source that wishes to remain anonymous, here are the
frequencies being used by the Louisville and Indiana Railroad Company
(LIRC):

Channel 1 161.070 MHz AAR Channel 64, Conrail Channel 2
Channel 2 160.860 MHZ AAR Channel 50, Conrail Channel 3

The LIRC operates the ex-Conrail (nee-Pennsylvania Railroad) Louisville
Secondary line that runs from Indianapolis to Jeffersonville. It is
owned by Anacositia Pacific, which also owns the freight operations of
the Chicago SouthShore and South Bend Railroad (CSS). Indiana communities
served by the LIRC include Greewood, Columbus, Seymour, Scottsburg, and
Sellersburg.

Where is this!?!? First I've heard of cops using CB as "secure"
communications.

It could be a reference to another channel on their system. I've heard
various PDs refer to: back channel, private channel, code <various>, side
channel (not sideband, tho'), etc. I can't belive they think they are
getting privacy ...

I am very sorry: the number is 4922. Sorry for the confusion.

attached is the header from the bill:

103d Congress H. R. 4922 As Introduced in the House

Note: This document is the unofficial version of a Bill or Resolution.
The printed Bill and Resolution produced by the Government Printing
Office is the only official version.

VERSION As Introduced in the House
CONGRESS 103d CONGRESS
2d Session
BILL H. R. 4922
TITLE To amend title 18, United States Code, to make clear a
telecommunications carrier`s duty to cooperate in the
interception of communications for law enforcement purposes,
and for other purposes.

IN THE HOUSE OF REPRESENTATIVES
AUGUST 9, 1994
Mr. Edwards of California (for himself and Mr. Hyde) introduced the
following bill; which was referred to the Committee on the
Judiciary

TEXT A BILL
To amend title 18, United States Code, to make clear a
telecommunications carrier`s duty to cooperate in the
interception of communications for law enforcement purposes,
HR 4922 IH - - 2
.

Ah, ha! This is the very first post that I've seen that says "hold down"
instead of "press" 2, 9, and MANUAL. This explains why the tricks have never
worked for me.

I used to like Police Call best but for use in Calif. Mobile Radio Resources published two great guides one for the Local Govt/Police/Fire services called GOVERNMENT RADIO SYSTEMS, and another called MILITARY RADIO SYSTEMS. Both are outstanding in their accuracy. They are a bit pricey at $27.00 and $37.00 but have served me well for years. They're my favorites for use in CA.

1002. Pro51 - my initial impressions

Newsgroup: rec.radio.scanner
Date: 1994-08-25 18:36:58 UTC
From: horak@convex.com
Message-ID: <33ioca$n6t@eugene.convex.com>
Source record: 270045

After reading the posts about the pro51 and salivating at the $199 price ($100 off list) I went to the local Rat Shack to check it out for myself since my old pro34 is getting tired. I can't carry my pro2006 with me and I hate to take my Yupi-7100 everywhere I go. So, I checked this pro51 out and did the keyboard mod while I was in the store. Also, I checked out the business/fire/police (850-870) band and found no cell images that were so prevelant on my pro34. I thought this was strange since the pro51 is a double conversion unit. Even the manual states an image problem 21 MHz *lower* than the actual frequency. Well, to my surprise, the images are in the 900 MHz band so this unit must be an UP conversion type! Horray! Now I can listen to the local cops without cell interference! Overall, the sensitivity doesn't seem bad at all and it scans like a bat out of Carlsbad at 50 CPS and searches at 100 CPS! I scarffed the pro51 up at the discount price and am pleased with it after the few hours I've had it. The 66-88 band appears dead (probably needs RF alignment or something) but I'll check that out when I can get out of this shielded building I'm in. The keyboard light stays on for 15 seconds after depressed, which I like! I was curious as to whether the MANUAL mode saves battery life as in the pro34 so I hooked up a current meter to the unit. In PGM and MANUAL the battery drain is a constant 64.5 ma on a non-active frequency. So, there appears to be no battery saving mode but the most current I saw it drain on an active channel was about 110 ma. The pro51 is small, lightweight and takes four AA batteries for power. It isn't a Yupi but it works for what I need. My pro34 was dying and you can't *enjoy* 800 MHz trunking with a Yupi due to the scan delay. My opinion is that if you can get it at the $199 price (for a few more days I'm told) get it. Otherwise, you may want something in a triple conversion model.

Enjoy,

David in Dallas

1008. Latest Intelligence: Revi

Newsgroup: rec.radio.scanner
Date: 1994-08-25 20:16:00 UTC
From: MC@SHORE.SHORE.NET
Message-ID: <93.722.7592.0NFB2F75@SHORE.SHORE.NET>
Source record: 269567

Message-ID: <33iu6i$gp2@shore.shore.net>
Newsgroup: rec.radio.scanner,alt.radio.scanner
Organization: North Shore Access; a service of Eco Software, Inc.

I am always intrigued by "secret information" books and when I noticed LATEST INTELLIGENCE by James E. Tunnell (TAB Books division of/McGraw Hill 1990, ISBN 0-8306-3531-9, $16.95) I just had to read it.

LATEST INTELLIGENCE describes itself as "an International Directory of Codes by Government, Law Enforcement, Military and Surveillance Agencies. Its a concise directory covering communication codes, radio frequencies, descriptions and explanations. It's absolutely fascinating!

The meanings of more than 35.000 terms, phrases, abbreviations and acronyms used in the intelligence, law enforcement, military and aeronautical communities have been compiled into one convenient, well-indexed volume. LATEST INTELLIGENCE was compiled with the assistance of the U.S. Department of Defense, INTERPOL, NASA, law enforcement and intelligence groups in America,Asia and Europe.

Stated objective of the book is "to provide fundamental information on subjects discussed in law enforcement, military and government radio communications". Topics range from radio codes used by law enforcement agencies to street slang for narcotics. A directory of worldwide law enforcement agencies is included.

Some of the "goodies" include:

* Amateur radio callsign prefixes (although these are somewhat dated, especially in regards to the former Soviet Union and its republics.)

* TV Audio frequencies including UHF translator channels and RCI sub-carriers.

* International Civil aircraft markings/identifiers.

* Cellular phone frequencies (both cellphone and repeater site) although for some unknown reason these are listed under Emergency Cellular Telephone Frequencies and they do not include the extended cellular band from 869.030 to 970.000 MHz.

* Worldwide emergency/distress and search-and-rescue frequencies.

* Federal law enforcement frequencies, including a comprehensive list of Immigration - Border Patrol

* Fire 10-codes.

* Traffic "prowords" and Q signals.

* Security clearance basics.

* Lists of sources of information on how and where to buy government surplus materials. This info alone is well worth the price of the book!

* Repeater frequencies used by Highway Patrols.

* Social Security Numbers codes decoded.

* Law Enforcement 10-codes (lists several meaning for each 10-code so this can be very confusing).

* List of U.S. Military Bases, Stations and related installations worldwide.

* comprehensive bibliography and list of resources.

and a whole lot more......

Overall my impression of this book is that it is very useful as a reference to general radio monitoring. My criticism is that it is somewhat dated (1990) although most of the information is still current. I was somewhat amused by the author's definition of a "Johnson" (street slang for a stolen vehicle). My knowledge of this word used in this context is something quite different). GLA is defined as an abbreviation for grand larceny - and it is my understanding that GLA specifically refers to auto theft - grand larceny auto. I noticed several errors (but these are bound to occur especially in a work that contains so much information.)

LATEST INTELLIGENCE has been prepared as a ready-reference guide to short-wave radio and scanner listening. LATEST INTELLIGENCE is a good bargain at $16.95 and bills itself as "the most comprehensive and up-to-date communications tool you can have on your bookshelf."
It has been placed in a prominent position on mine!

The unit is not as sensitive as many other scanners, but it shouldn't be
out and out terrible. Check at the back of the unit and make sure the ATT
switch is set at 0 and not at 10. The unit will have bad reception if the
switch is set at 10.

Portland is in the process of transitioning to an 800mhz trunked system.
Names (like TAC-II) won't refer to a particular frequency. Unless you
have a radio that understands the data channel commands from the system
controller, all you can do is scan among the assigned 800mhz frequencies.

: pressure and violence. They are attracted to the job. So don't whine
: about the risks etc. It is your choice.

You are right Richard, it is our choice. I get up out of bed everyday and go to work because I want to do so, not because someone is forcing me to. Just the same as no one is forcing you to do whatever it is you do for a living. However, the argument and attempt to make the job less hazardous is valid. If it is possible to make my job safer, I will do it. Just as a salesman doesn't like dealing with asshole customers, defective products, unexpected supply dealys, etc., the police officer doesn't like getting assaulted, stabbed, or shot at. Those sorts of things tend to make for a long day <G>.

But this is a bit off of the original point of the thread. The argument was concerning cops who do/don't like scanners and the reasons why. I personally have no problem with scanners. I know some of the more sophisticated thugs use them, but who can say as to how effective they are at keeping them from getting caught? We've caught several burglars and dope dealers with them (so I guess it didn't help them in those circumstances). Crooks' use of scanners isn't really a concern of mine.

The only problem I can recall having with a "scanner enthusiast" was on a prowler call. A woman called in saying she was in her upstairs bedroom, alone in the house, and heard a window breaking downstairs (possible burglary in progress). Upon arrival at the scene I cut my lights, parked my unit several houses down the street, and approached on foot. As I got up to the house I saw, standing between the house in question and the house next door, a figure with something in his right hand. He was in complete darkness and all I could see was his silhouette. I spotted him with my light and drew down on him and yelled, "Police! Let me see your hands!" He turned and squinted into my flashlight and didn't do anything for a couple seconds. I wasn't sure what he had in his right hand but it protruded and was shiny and black. I ordered him to drop it and get his hands up. Finally he did so, looking sort of shocked. As I got closer he said, "It's just a flashlight!" I had him place his hands on his head and frisked him down while my backup covered me. He had walkman headphones on and a scanner in his coat pocket. I placed him in cuffs

and sat him in the cage in my unit. After checking the house and questioning him about what he was doing here, it was finally determined that he was not the suspect but a neighbor from a few houses down who heard the call go out and wanted to check it out. I scolded him about coming to the scene and sent him home. When we checked the house we could find no signs of broken windows or entry. When we checked inside we found a broken vase that had fallen off of a shelf somehow.

The main thing I learned from this call is that people who aren't involved in an incident, especially one like the above, need to stay away from the scene. When officers arrive at a call like that EVERYONE is a suspect until proven otherwise.

Again, I have no problem with scanners and listeners (it was a hobby of mine before becoming an officer). But you shouldn't go to the scene. If you have some vital information, call 911 and let them relay it to the officers.

Just my two cents worth...

-=> Quoting Lance Kurt Van Landuyt to All <=-

LKVL> As I bought a Radio Shack Pro-51 scanner yesterday, the salesguy
LKVL> was trying to show me ho to do this 3-key sequence that if I hold
LKVL> them before I turn it on, it would enable me to do a complete
LKVL> search of ALL the 800 mhz frequencies! He forgot what it was. It
LKVL> was 9-(something)-LOCKOUT. He said a customer saw it in a JULY
LKVL> issue of a scanner magazine. Does anyone know the correct
LKVL> sequence? Any help would be GREATLY appreciated! Any other
LKVL> secrets regarding the pro-51 are also welcomed. Thanks for your
LKVL> time.

Product...Realistic Pro-51/Pro-23/Pro-46
Made by Uniden for Radio Shack, a Tandy Corp.

Purpose...Access gaps in the 800 Mhz band

** Disclaimer...Perfomring these steps are done at your own risk.

** Note...Perfoming these steps may access portions of the 800 Mhz band
that is against federal United States law to monitor.

** Certain portions of this document have been modified from the original
document to conform to the policy of several nets.

Information is from the July, 1994 issue of Monitoring Times p.99.
Further, Larry Wiland is given credit for providing these procedures.

1. With the radio switched off, hold down the 2, 9 and LOCKOUT keys;
turn the radio on and release the keys.

2. Step to channel 23 on the '51 or channel 15 on the '23 to display a
factory test freq in the 800 Mhz gap. (Not sure on the '46.)

3. Press either the up or down search arrow to scan the band in proper
30 khz steps. You may temporarily store up to 10 active freqs by pressing
MONITOR.

To permanantly store the freqs in the gap to have a starting point for
searching...

1. Step to the MONITOR channel you wish to permanantly store, then press
PROGRAM, then the desired memory channel number (including those with
factory-preprogrammed test frequencies.)

2. Press in sequence PROGRAM, MONITOR, ENTER. Repeat steps 1 and 2 for
each channel to be memorized.

BRB> I tried the same mod and got the same results.
BRB> Will installing another diode back to D9 as well as D11 solve this
BRB> problem?

Remove D9. Nothing in the 66-88 Mhz range that you would want that can't
be found on TV. Besides, the unit doesn't pick up well in the 66-88 Mhz
range anyway without an alignment of the radio.

Forget the 66-88 Mhz range. Remove D9 and the 30-50 Mhz will be
restored. Nothing in the 66-88 Mhz range that you couldn't get with a TV.
Besides, the unit would have to go through a realignment for the mod to be
effective.

>incalcuable number in my community.

People are people no matter what you call them. They should be judged as
individuals not as a group.

Just because a person wears a badge does not make him a "good" cop. There
are plenty of bad cops too. Listening to police "shopping" the Interstate
for folks that "fit the profile" in order to find vehicles for forfeiture
is a one example. More than once I've heard a police officer comment how his
"boss" needs a new unmarked car and how they needed to shop the highways for
one. And then proceeded to shake them down.

And how often have you seen a police officer turn on his (or her) lights in
order to run a red light and then turn into the nearest 7-11 (fresh donuts)?
Happens all the time.

Considering I pay for the police officers in my area, I personally feel that
the taxpayers the right to monitor most transmissions. I say most because
I also believe that some information need to be protected (names of undercover
officers, juvenile offeneders names, rape victims, etc.).

If there is a crime in my neighborhood I want to know about it.
Last weekend about two blocks from my house was a murder suicide. When I heard
that there was shooting going on I made sure that my kids were accounted for.
If I didn't have a scanner I wouldn't have known until the evening news. A little
late to check on them.

Which would you rather have; a police state or a free country? If you have
something to hide from your employeers (the taxpayers) maybe we need to listen
a little harder.

Oh yes, I am an volunteer emergency radio operator with my county sheriffs office.
A great bunch of folks. A fine example of "good" cops.

Jim,

I haven't read the actual FCC regs yet, but I had been assuming that
the GMRS license applied only to the licensee and his/her immediate
family, and have hesitated in getting radios for that reason. Is it a
legal use to hand a radio to non-licensed, non-family member and
communicate with them?? With CB's, I know it wasn't.

Thanks,
dale

95.179 tells you who may be a station operator. A system licensed to an idvidual can be used by the licensee's *immediate family*. Immediate family is defined as the following, living in the same household as the licensee:

95.179 (a)(1) Licensee
(2) Licensee's spouse;
(3) Licensee's children, grandchildren, stepchildren;
(4) Licensee's parents, grandparents, stepparents;
(5) Licensee's brothers, sisters;
(6) Licensee's aunts, uncles, nieces, nephews, and
(7) Licensee's in-laws.

95.179(b) defines who may be a station operator on a system licensed to "non-individual" (business). Essentially any employee engaged in communications on the licensee's behalf.

From what I have read, Jim's example of giving GMR sets to friends is not permissable. Allowing family to operate is OK - but the regs say they are supposed to be living in the same household. I would probably cheat on the household point if I was on a road trip.

>dgc

I have scanned the 800 band looking high and low for the TAC II calls and I haven't been able to find them..

The trunked freqs seem to have only dispatch (NET 1 NET 2 etc)...

The calls are something like "5155 can I have 5555 on TAC II" and then the dispatch side will say something like "5555 TAC II", I can't find these calls ANYWHERE in the trunked freqs.

Take Easy

James Carter (jcarter@orl.mmc.com) wrote:
: Caution on posting scanner mods here.

Insignificant, this is an INTERNATIONAL newsgroup, as such no fines can be imposed on discussions of scanner modifications since in other parts of the world these units can be readily bought and sold without any problem whatsoever. Additionally, the constitution guarantees FREEDOM OF SPEECH, which I am presently exercising to it's fullest.

It is legal to purchase a Pro-43 here that is approved and a replacement digital board from Tandy UK and restore it. It is also legal to purchase a scanner for possession or use overseas and not for use in the U.S. but for storage in the U.S. or display, anything except it's normal use.

Most interestinly is Jeff Lieberman of the Ham Station had the nerve recently on CompuServe in HamNet to suggest censorship of any type of discussion on non FCC approved scanners, obtaining of, where to buy from, phone numbers, addresses, and reviews of. He asked the Sysop to take action in the Forum. Well 99% of the votes were against him -- he may even be out of business as a result of his negative pro-business attitude (his business in particular). The official decision was - no change, business as usual, except I don't know of anyone who is now willing to buy from him.

His attitude went something like this:

I no longer have any cellular restorable scanners in stock and no-one will buy them from me. Therefore it is wrong for the overseas folks to be selling their scanners to folks in the US and taking away my business, for this reason, I want the Sysop of Hamnet to stop the advertising of these companies from overseas which are putting me out of business (here, take my hanky Jeff!)

Guess what kiddies, this is what I predicted would happen when I suggested the companies get together, pool there money and resources and get the needed legal muscle to do something about the new dumb stupid law -- which WILL affect their business. Even Grove is now starting to feel it. They thought it would not affect them, well kiddies, WRONG! Why buy a scanner with holes in it when you can get a full coverage international model? Does not make sense not to.

In any event, the same holds true for CompuServe, its an international global service, as such -- even if it were true that it was not legal to make the information public, it would be insignificant since those laws do not affect overseas subscribers. BTW, it is NOT true.

Irrelevant material follows:

: FCC FINES CAN REALLY HURT - The FCC has been known to hand out some pretty
: stiff fines for infractions of the rules. Recently, the FCC San Juan, Puerto
: Rico, office issued a fine of $7,000 to NP4VG for willful interference to
: another amateur station. NP4VG was operating an otherwise legal repeater
: which interfered with the WP4CNU repeater, which was a coordinated repeater
: (NP4VG's was not). In another action, the FCC fined Ace Communications of
: Fishers, Indiana, $20,000 for marketing illegal scanner radios (cellular phone

want better performance outa your 2006 but dont like heights?
get the ratshack ducky windo attacher, attach your duck or your whip to it
..put in in your windo... high up as you can then attach it to the bnc
on the back of your radio... make sure the attenuator is off! :)
itll work muuuuuch better than the stock radio and i expect youll see an
improvment over havin the ant attached directly to the back of the radio

i think the windo mount costs under ten bucks, and you could probably
make something similar yourself if youre handy...

have fun

I don't know why people (or at least people who sell scanners) make such a big deal about aircraft communications that can be heard with scanners.
In a Damark catalog description of a scanner it was written that you could listen to the "exciting minute to minute banter" between controllers and pilots. Many catalogs make a special point of mentioning that their scanners get air band.
Whenever I listen to pilots and controllers talking I find it boring. They just say brief commands like "128 descend to 7000 feet". I live in Manhattan enabling me to hear three major airports: JFK, LGA and Newark, so it's not like I'm missing something. I understand that during an aircraft emergency it might be exciting, but can somebody please tell me what people find about listening to air band so great?

Most Community Repeaters use a tone card for each authorized user to activate the system. Multiple user systems are better off using a tone panel where each users sub audible tone (67.0 hz to 250.3 hz) is programmed in instead of all those indivudal tone cards.

Digital CTCSS extends n he numbers out eaven further .

GMR ruls state that an indivudual must have permission to use community repeaters or fixed relay stations directly from the system provider.

YES! At least along the San Diego to Los Angeles California coastline. Offshore air traffic control (entering/leaving US territorial airspace) navy ships, navy/marine aircraft, and space shuttle/ground support ops personnel at edwards airbase, national guard riot suppression personnel have all been commonly heard within the 220-400 MHz frequency range.

1041. Digital scanning

Newsgroup: rec.radio.scanner
Date: 1994-08-26 03:14:44 UTC
From: tmnichol@nps.navy.mil
Message-ID: <33jmn4$30j@sagan.nps.navy.mil>
Source record: 269928

I have Heard a lot of talk/discussion about digital and how scanning will soon be gone. This is how I see the future:
Soon companies like Icom, Kenwood, etc will start building digital scanners. The demand will be there and these companies will fill this demand.
I know in theory there are many digital modulation scheme out there, BPSK, QPSK, etc, but in reality only a few are used on a wide basis. For example, Motorola equipment is used by the majority of police departments and fire departments and is really the equipment of choise for many users. Digital Motorola equipment uses one type of modulation, so you simply build a scanner that can demod BPSK or what ever the modulation scheme is.
Scanners now have AM, FM, WFM. You should be able to buy scanners with several demod features like QPSK, BPSK, etc. Instead of having only three modes as is now the case, scanners will be equiped with digital modes.
Freq lists (Police Call) will have an added column for the modulation type.
Now, when you start talking spread spectrum and encryption, that is a different animal. However, not everyone will be employing those capabilities.

Any thoughts here? I am always open to constructive critism/discussion.

1042. Which Radio Shack Units Now Modifiable?

Newsgroup: rec.radio.scanner
Date: 1994-08-26 03:23:53 UTC
From: g9153402@huey.csun.edu
Message-ID: <33jn89$m9r@nic-nac.CSU.net>
Source record: 269926

Got questions if any of the following is now modifiable:

I'm looking at the new, 1995 Radio Shack catalog. Page 30 shows their 800 mhz home scanners. They now have five models, with four being new. Are any of them modifiable? Has anyone found out the procedure to modify them, or are they totally unmodifiable unless one is a rocket scientist? The scanners pictured are:

PRO-2035 $449.99 It looks like their best scanner ever made, with 1000 channels, and a whole bunch of other goodies. I would buy one, if I won the lottery. Looks great, but since it's new for 1995, does that mean it's unmodifiable?

PRO-2036 $319.99 Nice unit too, but is it modifiable?

PRO-2037 $299.99 Nice unit too, but is it modifiable?

PRO-2039 $229.99 Nice unit too, but is it modifiable?

PRO-2030 $199.99 This is the only unit being sold that also was sold last year. I own one of these, and did modify it by cutting a diode, and it now does scan in the previously unusuable 800 mhz band, in the proper 30 khz spacing. But do the newer units still posess this capability, or are these now unmodifiable? When was the cut-off date? How do you tell an unmodifiable unit from a modifiable one without having to open up the unit?

Any info appreciated...

Steven Bradley (steven@sgb.oau.org) wrote:
(stuff deleted)

The way I see it, this is a freedom of speech issue. In the U.S., and I'm sure zillions of other countries, we have it. I doubt it is against the law to discuss scanner modifications. It isn't against the law to have a discussion on how to rob a bank, but it is against the law to actually go out and rob a bank! But as far as scanners are concerned, these products can get fairly expensive. And if I'm buying such a product, I would like to obtain one that is least crippled as possible, with all bands accessible. It isn't that I sit home listening to cell calls all day, but would still like that band available, especially if some other useful service starts transmitting within it.

Just my opinion...

Marc,
There is a review of the AR8000 in this month's Monitoring Times
from Grove. Overall, I am very impressed w/ the unit...great features
and good performance across the board. 20 search banks, 20 scan
banks of 50 chs each and alpha tags for each channel. There should
soon be sw for the PC for programming these puppies too...has a
weird connector in battery compartment to connect.

ANNOUNCING ....

PHILLY
PHREQUENCY
PHONE tm

(215) 552-8940 - 24 hours a day!

This new telephone line will be used to keep scanner users in Eastern Pennsylvania and South Jersey up to date on new frequencies and other information of listening interest in their own locales.

Callers are encouraged to leave updated scanner information on the line after listening to the message. Callers' reports will be offered the following week when the newscast is updated.

Philly Phrequency Phone (tm) will not offer updates until later this year, however, the line is offering information to callers at the present time. Callers can find out the status of scanner clubs in the Northeastern United States by calling now.

Northeast Scanning News has become a 16-page insert to National Scanning Report. In an effort to keep the spirit of a scanner club alive in the Northeast, the All Ohio Scanner Club's American Scannergram will be expanded early next year to accommodate regional columns covering the Northeast. For a report on these events, please call PHILLY PHREQUENCY PHONE now at (215) 552-8940 anytime, day or night.

The ALL OHIO SCANNER CLUB will be expanding its coverage into the Northeastern U.S. early next year. Here is a membership application and information sheet that you can print out and mail in!

Chuck, scan911@aol.com

AMERICAN SCANNERGRAM
Serving Ohio and the Surrounding Areas With the Most Up To Date Radio Monitoring Information That Is Available!
Official Publication of the
ALL OHIO SCANNER CLUB 50 VILLA ROAD, SPRINGFIELD, OHIO 45503-1036

The ALL OHIO SCANNER CLUB is a not-for-profit organization that is dedicated to sharing information and improving the hobby of monitoring radio communications. The AOSC newsletter is staffed by a group of dedicated volunteers who work together to publish a top notch information exchange and reference source for our members.

The AOSC was founded in 1979 by a scanner enthusiast who wanted to aid in bringing together people interested in the same hobby and to share information such as frequencies, codes, and technical knowledge that is helpful to the hobbyist. Since then, the AOSC has grown to include hundreds of members in over 40 States and Canada, and the newsletter has grown from a mimeographed single sheet to newsletters averaging 40 pages or more that are professionally printed and bound.

The ALL OHIO SCANNER CLUB publishes an information exchange newsletter, called the "AMERICAN SCANNERGRAM", every two months for club members. The newsletter includes regional public safety columns covering all of Ohio, plus Illinois, Indiana, Kentucky, Michigan, Pennsylvania, West Virginia, Ontario, and other areas of North America as well. Other columns include subjects of special interest such as state government; business; sports, including major league baseball and football, auto racing; special events; tourist attractions; aviation, railroads, and other modes of transportation; technical topics; articles about antennas and improved reception techniques; articles to help the beginners in the hobby; understanding public safety communications; and two no-holds-barred columns covering Federal Government, and U.S. Military services. Many of these columns of special interest topics provide nationwide coverage. Also included are columns covering amateur radio; new licenses from the files of the FCC; shortwave utilities; shortwave broadcast; new product and book reviews; and

other features. All of these columns are based on information sent in for publication by club members such as yourself. We are an all volunteer organization, no one receives payment for material written for our publication.

The cost of membership in the ALL OHIO SCANNER CLUB is $18.00 per year ($21.00 for Canadian and Mexican residents, $28.00 for all other countries), payable in U.S. Funds. Membership dues are non-refundable. (A newsletter sample copy is available for $3.00). New members will receive a booklet containing general information about the club; frequencies, codes, and other statewide information for Illinois, Indiana, Kentucky, Michigan, Ohio, Pennsylvania, West Virginia, and Ontario, Canada. Your membership will begin with the next regular mailing of the club newsletter, and will expire after you have received six issues. We print the American Scannergram every other month. Issues are normally mailed by third class bulk rate the last week of February, April, June, August, October, and December.

The AOSC holds an annual family-style picnic and business meeting (if necessary) at a private park shelter in the Columbus, Ohio area. The AOSC hosts a booth for all Association of North American Radio Clubs at the Dayton Hamvention in Dayton Ohio each year (normally the last weekend of April), and also participates in the Winter SWL Festival in Kulpsville, PA the second weekend of March every year and the Monitoring Times Convention (to be held in Atlanta, GA the first weekend of October this year). At the Dayton Hamvention, The AOSC co-sponsors a forum for shortwave and scanner listeners. A social gathering and meeting for AOSC members is also scheduled each year during each of these events. The AOSC also sponsors a net on a Dayton, Ohio area amateur radio repeater for scanner and shortwave listeners.

The AOSC can be reached on America Online or any other online service with an Internet gateway by leaving a message for Dave Marshall at davem0911@aol.com.

Why not join today by filling in the information below and include it with your check or money order (no cash, please) and send it to the address above, and you will become part of the growing group of scanner buffs that are "in the know".

I've owned the MR-8100 for about 2 years, here's my opinion;

No search kinda sux and the automatic delay is sometimes a pain too.
High RF interference sux as well.

The positive.......it's probably the most rugged scanner I've seen
to date and the reception is pretty good too. Also, it's one of the
only mobile scanners I've owned yet that doesn't fail or perform
poorly under extreme temperatures.......in New England it gets pretty
cold...-46 no wind chill last year...generally extreme high and low
temps are not good for electronics anyway but the MR-8100 performed
flawlessly through all the cold days...and hot ones too...it's
on ALL the time. Lastly...it's L-O-U-D!! I can leave the windows
down and hear it clearly within' 25-30 yards with the volume at
about half....even with the volume at full blast there is little if
any distortion....wanna calm your neighbors down? Crank this thing
up and they'll think 5-O just pulled in. If it died or got stolen
I'd probably go right out and buy another one.

Steve,

Having been a "Scannered Manhattanite" for years there really isn't anything
"that" faccinating about normal ATC unless you're a real plane nutane nut.

Hell, even NYPD is bornring until a 10-13 comesomes over the air. About the
only consistantly "interesting"" freq is ESUU.

Here in Boston I use the ATC freqs to monitor the delae weather delays ssince
the airlines tend to let you get to the airoporport and then tell you a lyou a
flight is cancelled.

John

For Sale,

My YUPITERU MVT 7100 scanner
I want to have 900 dutch guilders for it.

Some specifications:

530kHz-1650MHz
1000 memory channels
wfm,nfm,am,lsb,usb
Steps 50Hz, 100 Hz, 1kHz, 5kHz, 6.25 kHz, 9kHz, 10 kHz, 12.5 kHz, 20 kHz
25kHz, 50kHz, 100kHz.
Scanspeed: 30 channels/sec
weight: 320 grams
size: 64,4x155x38.2 mm

It is a portable scanner, with nicad bateries, and charger (you can use
the scanner while charging)

Interested mail me

Donar Alofs

donar@cs.vu.nl or donar@nijenrode.nl

This machine is THE BEST on the portable market today!

Communicating in the clear is not a matter of stupidity, it is a
matter of the public's right to know what the assault werapon armed
thugs which wear black or blue uniforms are up to, whose liberty
they are targeting today and where they go next.

>
>The ONLY way you will "get a break" is if your department is savvy enough

>and the data stream encrypted with a decent DES algorithm.
>

THis is a really dumb idea, very stupid indeed. Do you really want the
police operating in secret? Boy you and Hitler/Stalin/(Feinstein?)
and probably Clinton/Reno really see eye to eye on this.
really see eye to eye on this.

>If cops continue to use STUPID communications, like old fashioned
>narrowband FM, transmitted in the clear, then I figure that they will
>continue to deal with somebody hearing it and "getting in the way".
>

And the citizens will still have the ability to keep the police in
some way accountable for their actions. Remember the
"gorillas in the mist" comment made by some of LA's finest
the night the beat the shit out of Rodney King? Well folks
if we were running crypto cops none of that would ever
have come out and it was relevant.

>Dean

Good point Steve. The majority of us do that. A few months ago the sheriff's had helicopters involved in searching for an armed robbery suspect about 2:00AM. I heard the chase progress and the action centered around my neighborhood. I noticed a subject fitting the description run through my neighbor's back yard. I phoned in my observations and immediately heard the dispatch notify the ground units of my scanner intercept and location of their suspect. A few minutes later another dispatch similar to mine resulting from a neighbor w/a scanner who lived further down in the development. Within minutes the suspect was apprehended. I hope this type of participation leaves a positive impression w/the PD's. We're not eavesdropping to catch law enforcement in some wrong doing. Quite opposite. We're here to support.

I've had mine about a day now and it seems to have up conversion with the cellular base images in the 900 MHz band but your image problem (from private email) seems to be in the 854 cop region. If this unit is up conversion the you could be getting the cell handset images from 824 to 851 up there at 854. What I find odd is that it shouldn't be a big problem since the cell handsets emit such low power. One thing is for sure, the pro34 that I have is down conversion and the high ERP from the cell bases completely wipes out the 851 to 868 band. Comparing the two scanners, the 51 seems better in the 800 band with the exception of the cell freqs. Since the pro34 is a down conversion model, the cell freqs are fairly free from images since the 900 MHz band is not used much yet. On the other hand, the 51 gets all sorts of business/fire/police from the mid 800 band showing up in the cell band making scanning cell stuff a lot harder. Also, I've noticed cordless phone images up around 67 MHz and ham 2m and 440 exactly 21.6 MHz higher than it should be on the 51 so I still think it is a up conversion model. The bottom line is that the unit is double conversion and it is going to have image problems all over the place. If you can't live with it, buy the 43 or another triple conversion model. The 34/37 won't be any better.

I guess they're just interested. I am a pilot and I find the 118-136 band more interesting than most emergency service. It's a kind of training aid for some of us. You can learn a lot about communications technique by just listening. Your on the air technique can be especially important when flying in congested areas (like New York) when you need services from BUSY controllers.

Why would anyone want to listen to taxi cabs, railroads, or garbage trucks? I see frequencies for this kind of service being shared among scanner buffs.

99% of the time I keep the local police/fire freqs locked out of my scanner. I monitor local air traffic near my house (Stockton approach/Oakland center), a couple of our company channels and a couple of ham repeaters. It just depends on why you want to even have a scanner.

I always wonder why people go to such extremes to listen to cell phones. That gets boring in about 5 minutes for me. I figure most people want to do it for the same reason dogs lick themselves.

Take care.

1060. Discone antenna

Newsgroup: rec.radio.scanner
Date: 1994-08-26 15:05:39 UTC
From: aldrin@opium.cs.odu.edu
Message-ID: <ALDRIN.94Aug26110540@opium.cs.odu.edu>
Source record: 269945

I just purchased a discone antenna from RS. I've read that a vertical
element needs to be attached to increase the reception of 25-100Mhz signals.
Does anyone know exactly what I need to hook up a vertical element to
the discone? I assume it is a CB whip (102-108"?) but can it be attached
directly to the discone?
Or should I have bought the ground-plane antenna that RS also sells?

Thanks,
Aldrin

>It could be a reference to another channel on their system.

No, its actually a SSB mode CB radio. I had a good friend who used to work at our 911 center and he confirmed it for me. They figure with all of the channels available, the constant shifting of channels, the lack of everyday use, and the lack of good scanning CB radios, they have a good chance of keeping their comms to themselves (notice I didn't say secure).

BTW, our PD is just like the keystone cops. It is somtimes funny to monitor them.

From: wwhitby@aol.com
Message-ID: <33l1tm$hkh@search01.news.aol.com>
Source record: 269948

I live in an apartment complex (ground floor) that won't allow me to put an antenna outside. I use an active antenna inside to make up the difference. The problem is with the nearby pager towers that were recently put up. They overload my scanner , but only on one or two frequencies. If I remove the active antenna, I lose a great many of the mobile units I listen to on other frequencies. My question: Is there any kind of good filter (notch or otherwise) that will allow me to remove the pager interference? I am desperate!

tnx in advance,

Warren Whitby

"Up conversion" means using a very high frequency (e.g., 700 MHz)
in the first IF, as employed in the PRO-2006. You are confusing
up conversion with "high side injection" and "low side injection" --
that is, whether the local oscillator is above or below the
receive frequency.

Also, many postings confuse up conversion with immunity from
intermod. The two concepts are not related at all.

Motorola made Motracs and a other receivers with low IFs that
had good freedom from intermod. It has more to do with high-Q (high
selectivity) front end filtering, transistor bias levels,
etc. -- not the frequency the IF.

Here's the details, from the Univ of Ill alumni letter:

Gary Kleck, writing _Point Blank - Guns & Violence in America_, received
the Hindelang Award, the American Society for Criminology's most
prestigious award for a book making the greatest contribution to the
field of criminology.

Most seriosly, his recent survey of 4,978 randomly selected households
from the 48 contiguous stats suggests that just over one percent of US
adults (2.5mill) used a gun defensively against another person in the

year prior to the survey. "Guns were three times as likely to be used defensively as aggresively," says Kleck, "and they thwarted crime far more often than they abetted it."

These results are particularly unsettling for gun control advocates because they come from one of their own. "I am a stereotypical liberal," says Kleck. "Before I undertook this study, I was a procontrol academic who believed instinctively that people should not have guns. Gradually, I came to see that the best available evidence did not support the case that is usually made for gun control: that guns automatically lead to violence. In fact, victims are less likely to get injured or lose property if they have a gun."

> I think that if they had thwarted actual crimes we would be

Same for McDonalds, etc. As far as cell, there is an art to
listening. During the day you'll find the bands crouded with 95%
boring business stuff. By 4-6pm, you'll still find it but there are
the occasional "I'll be late at the office dear" men on their way to a
hanky panky rendezvous. After the rates go down, the bands are less
crouded and there are more interesting things to listed to. Late
night, between 10-12pm, especially on Friday and Saturday, you'll here
the drunks, the arguments between lovers, the phone sex, etc. Really
late night (especially Fri/Sat) between 11pm and 4am, you'll hear the
police calling in things they "don't want you to hear on the police
bands". It can be fun listening to the cops say, "Is there a number I
can call you at?" and then scan the cell bands to hear what is so
secret. Cell can be boring but if you know when to listen, you'll
catch the big ones that *didn't get away* :-)

>what people find about listening to air band so great?

I think ads mention Air Band because many scanners don't get it. I'm a private (toy!) pilot and find it interesting to listen to the progress an aircraft makes from "Push Back" (leaving the gate) through handoff to the center. I guess it's as interesting as knowing Joe Bloggs car was stolen from Winn Dixie's parking lot!

Come to think of it.... why does anyone buy a scanner?

[SNIP! ... whew!]

Ok, my turn....

First, I am for people having scanners and being able to monitor ANY traffic that is via radio. However, there comes a point where some put the scanner on their belt and instantly they are a COP. As for situations not being "botched by a scanner" You wern't there the day I had to park my ambulance 1 block back because I couldn't get to the scene of the accident. We gave some tickets for interfering, but that didn't really seem to work. About that time, I really started to change my mind about having a scanner law prohibiting scanners in a mobile enviroment. (I detest these laws!!) So, our department came up with the next best thing... we activated EVERY fire, police, and EMT pager in the city... said there was a hugh accident at the fair grounds and drove every emergency vehicle out there. Made for a neat parade with cars intermixed with the fire trucks. When everybody got into the fair grounds, we shut the gate, and the only way to get out was to get a ticket for interfering with emergency vehicles. It worked quite nicely. People still have their scanners, they still listen, AND THEY STILL HELP, but they know that on scene,

to stay away.
As for still helping, we have some dead spots in the county as some scanner folks are nice enough to relay via phone for us.

Again, we SHOULD be able to listen but ACTING on that information is a completely different matter. It is those who play wanna be cops and show up at scenes that get laws prohibiting mobile scanners, scanners run from 12 volts, etc. written. Enjoy, this is *only* a hobby!

Hi!

Can anyone out there give me the simple names for the modes
designated:

A2A
A2D
A7W
C3F
F1B
F1D
F1E
F2D
F3A
F3
F3F
F7W
F8W
F9
F9W
G1D
G7W
N0N
P0N
XXA

I have a photocopied page that shows you how to break these things out,
but the definitions it'll give you are NOT user friendly. So, if anyone
can provide the simple terms for each of these modes I'd be grateful.

Please email me at lee@tosspot.sv.com.
Thanks,
Lee.

I am looking for a magnetic mount antenna for my car for scanning.
RS has one for $29 and I have seen a couple advertised in Pop. Com.
that cost about $19. Does anyone have any suggestions or experience
on if one is any better than the other.
Thanks for any help,
Jerry

Careful. There are certain illegal activities whose discussion will get you a visit from many federal agencies and more grief than you could ever imagine! Threaten an elected official or "joke" about a bomb as you board a plane and you'll learn very quickly what free speech is all about.

The point is that it is not illegal to modify a scanner or to possess a scanner capable of receiving the forbidden frequencies. The only thing that is illegal is listening to those frequencies. Many expect the monitoring restrictions of the ECPA to be overturned as soon as someone whose pockets are sufficiently deep takes on the cell phone industry (and the cost of the litigation suggests that no one is going to do it voluntarily). This being the case, why purchase equipment that has been shown to be unrestorable? Discussions of modifications are vital if consumers are to know what equipment might server their future needs when restrictions are removed. However, I predict that the removal of restrictions will coincide with the widespread adoption of digital and encrypted transmissions, so it's all moot in any case. The ECPA is merely a weak attempt to buy the cell industry a few years to convert.

>
>Answer...It's too early.

It wasn't Radio Shack, but I was a store a few days ago, and my friend
was buying some items and included one for me. I owed him $2, but all I
had was a $20. So, I ask for change from the cashier, she says "I can't
make change if you don't buy something". I loked at her, smiled, and
asked her if she'd ever seen "Falling Down". At first she looked
confused, then she looked a little uncertain.

At least I didn't make her roll back the prices.....

I agree. And as scanner enthusiasts we can use judgment and discretion.

From the bulk of our laws it's clear that most people favor "safety".
Problem is, trading liberty for security results ultimately in neither.

Look at the newsgroup name; it starts with "rec", as in recreation. That's
what this newsgroup is about. And if cops *don't* continue to use old fashioned
narrowband FM transmitted in the clear, then the recreational scanner users
who enjoy listening to police and fire aren't going to have much of a hobby,
are they?

If law enforcement officers feel that they are being hampered by nosey
scanner listeners, they will convert their communications systems to
something less convenient or impossible for the average hobbiest to
listen to.

No, this is the reason why the Pro-43 is more expensive than
the Pro-39. The 43 has an internal PROM that will store all of
your programmed freqs indefinitely, without any power. All of the
other handhelds will store them for about 1 hour without power.

I just scanned down to the end of the bands (869.01 and 894.00) and loaded
those into memory. I don't want a bunch of cell channels in my memories.
Besides, there are several hundred of them. With these two, I can scan
all points in between.

>receive frequency.

Well, OK. I see what you're saying. I hope everyone knew what I meant
since the scanner is double conversion and I was talking about the 10.8
IF oscillator. The images seem to be converted up 21.6 (not 21.4) MHz
instead of down like most R/S scanners I've seen.

>Also, many postings confuse up conversion with immunity from
>intermod. The two concepts are not related at all.

Correct. I'm talking images here. But while we're at it, the unit
does seem to be fairly prone to intermod too but that's no surprise.

While this may be a valid benefit of the pro43, there are several features
which make the 43 more valuable including the 200 MHz band, AM/FM switch
and triple conversion (isn't the 39 dual?). Also, the 43 can be modified
to include the 54-88 band.

>I have a motorola 550 cellular phone and was curious if it is possible?
>and if someone knew how.

You have to place the phone in test mode with a little pice of tim foil
on the middle connector then place the battery on the phone.;
After that you have to un-mute the audio and then load a cellualr channel
into the memory. The cellular channle will be a 3 digfit number. The
codes you need are in a back issue of nuts volts or the motorola service
manual. If you can't get these emial me and I'll try to fax the pages to
you or something maybe read them to you over the phone...

Here it is folks! After sounding like a moron when I called my
representatives and didn't have the info they needed I did a little
digging at the Library of Congress telnet site. The correct bill number
is HR4922, NOT HR3822 (which relates to merchant ships or something).
This clearly outlaws scanners and I urge you to get on the phone with
your Congressional representatives and let them know how you feel about this.

In addition to banning scanners, it looks like this may be another FBI
wiretap proposal. That may provide more incentive to call your
representatives. Although I have not examined the bill in great detail,
I found it to be the bill in question by skimming.

Here it is:

103d Congress H. R. 4922 As Introduced in the House

Note: This document is the unofficial version of a Bill or Resolution.
The printed Bill and Resolution produced by the Government Printing
Office is the only official version.

VERSION As Introduced in the House
CONGRESS 103d CONGRESS
2d Session
BILL H. R. 4922
TITLE To amend title 18, United States Code, to make clear a
telecommunications carrier`s duty to cooperate in the
interception of communications for law enforcement purposes,
and for other purposes.

IN THE HOUSE OF REPRESENTATIVES
AUGUST 9, 1994
Mr. Edwards of California (for himself and Mr. Hyde) introduced the
following bill; which was referred to the Committee on the
Judiciary

TEXT A BILL
To amend title 18, United States Code, to make clear a
telecommunications carrier`s duty to cooperate in the
interception of communications for law enforcement purposes,
and for other purposes.
Be it enacted by the Senate and House of Representatives of the
United States of America in Congress assembled,
SECTION 1. INTERCEPTION OF DIGITAL AND OTHER COMMUNICATIONS.
(a) In General . - Part I of title 18, United States Code, is
amended by inserting after chapter 119 the following new chapter:

`CHAPTER 120 - TELECOMMUNICATIONS CARRIER ASSISTANCE TO THE GOVERNMENT
`Sec.
`2601. Definitions.
`2602. Assistance capability requirements.
`2603. Notices of capacity requirements.
`2604. Systems security and integrity.
.
`2605. Cooperation of equipment manufacturers and providers of telecommunications support services.
`2606. Technical requirements and standards; extension of compliance date.
`2607. Enforcement orders.
`2608. Reimbursement of telecommunications carriers.
`Sec. 2601. Definitions
`(a) Definitions . - In this chapter -
`the terms defined in section 2510 have, respectively, the meanings stated in that section.
` `call-identifying information` -
`(A) means all dialing or signalling information associated with the origin, direction, destination, or termination of each communication generated or received by the subscriber equipment, facility, or service of a telecommunications carrier that is the subject of a court order or lawful authorization; but
`(B) does not include any information that may disclose the physical location of the subscriber (except to the extent that the location may be determined from the telephone number).
` `Commission` means the Federal Communications Commission.
` `government` means the government of the United States and any agency or instrumentality thereof, the District of Columbia, any commonwealth, territory, or possession of the United States, and any State or political subdivision thereof authorized by law to conduct electronic surveillance.
` `information services` -
`(A) means the offering of a capability for generating, acquiring, storing, transforming, processing, retrieving, utilizing, or making available information via telecommunica.
tions; and
`(B) includes electronic publishing and messaging services; but
`(C) does not include any use of any such capability for the management, control, or operation of a telecommunications system or the management of a telecommunications service.
` `provider of telecommunications support services` means a person or entity that provides a product, software, or service to a telecommunications carrier that is integral to such

carrier`s switching or transmission of wire or electronic
communications.
` `telecommunications carrier` -
`(A) means a person or entity engaged in the transmission
or switching of wire or electronic communications as a
common carrier for hire (within the meaning of section 3(h)
of the Communications Act of 1934 (47 U.S.C. 153(h))); and
`(B) includes -
`(i) a person or entity engaged in providing
commercial mobile service (as defined in section 332(d)
of the Communications Act of 1934 (47 U.S.C. 332(d)));
and
`(ii) a person or entity engaged in providing wire or
electronic communication switching or transmission
service to the extent that the Commission finds that
such service is a replacement for a substantial portion
of the local telephone exchange service and that it is
in the public interest to deem such a person or entity
to be a telecommunications carrier for purposes of this
chapter; but
`(C) does not include persons or entities insofar as they
ar.
e engaged in providing information services.
`Sec. 2602. Assistance capability requirements
`(a) Capability Requirements . - Except as provided in
subsections (b), (c), and (d) of this section, and subject to
section 2607(c), a telecommunications carrier shall ensure that its
services or facilities that provide a customer or subscriber with
the ability to originate, terminate, or direct communications are
capable of -
`(1) expeditiously isolating and enabling the government to
intercept, to the exclusion of any other communications, all
wire and electronic communications carried by the carrier
within a service area to or from equipment, facilities, or
services of a subscriber of such carrier concurrently with
their transmission to or from the subscriber`s service,
facility, or equipment or at such later time as may be
acceptable to the government;
`(2) expeditiously isolating and enabling the government to
access call-identifying information that is reasonably
available to the carrier -
`(A) before, during, or immediately after the
transmission of a wire or electronic communication (or at
such later time as may be acceptable to the government);
and
`(B) in a manner that allows it to be associated with the
communication to which it pertains,
except that, with regard to information acquired solely
pursuant to the authority for pen registers and trap and trace
devices (as defined in section 3127), such call-identifying

information shall not include any information that may disclose
the physical location of the subscriber (except to the extent
that th.
e location may be determined from the telephone number);
`(3) delivering intercepted communications and
call-identifying information to the government in a format such
that they may be transmitted by means of facilities or services
procured by the government to a location other than the
premises of the carrier; and
`(4) facilitating authorized communications interceptions and
access to call-identifying information unobtrusively and with a
minimum of interference with any subscriber`s
telecommunications service and in a manner that protects -
`(A) the privacy and security of communications and
call-identifying information not authorized to be
intercepted; and
`(B) information regarding the government`s interception
of communications and access to call-identifying
information.
`(b) Limitations . -
`(1) Design of features and systems configurations . - This
chapter does not authorize any law enforcement agency or officer -
`(A) to require any specific design of features or system
configurations to be adopted by providers of wire or
electronic communication service, manufacturers of
telecommunications equipment, or providers of
telecommunications support services; or
`(B) to prohibit the adoption of any feature or service
by providers of wire or electronic communication service,
manufacturers of telecommunications equipment, or providers
of telecommunications support services.
`(2) Information services and interconnection services and
facilities . - The requirements of subsection (a) do not apply
.
to -
`(A) information services; or
`(B) services or facilities that support the transport or
switching of communications for the sole purpose of
interconnecting telecommunications carriers or private
networks.
`(3) Encryption . - A telecommunications carrier shall not
be responsible for decrypting, or ensuring the government`s ability
to decrypt, any communication encrypted by a subscriber or
customer, unless the encryption was provided by the carrier and the
carrier possesses the information necessary to decrypt the
communication.
`(c) Emergency or Exigent Circumstances . - In emergency or
exigent circumstances (including those described in sections 2518
(7) or (11)(b) and 3125 of this title and section 1805(e) of title
50), a carrier may fulfill its responsibilities under subsection

(a)(3) by allowing monitoring at its premises if that is the only means of accomplishing the interception or access.
`(d) Mobile Service Assistance Requirements . - A telecommunications carrier offering a feature or service that allows subscribers to redirect, hand off, or assign their wire or electronic communications to another service area or another service provider or to utilize facilities in another service area or of another service provider shall ensure that, when the carrier that had been providing assistance for the interception of wire or electronic communications or access to call-identifying information pursuant to a court order or lawful authorization no longer has access to the content of such communications or call-identifying information within the service area in which interception has been occurring as a result of the s.
ubscriber`s use of such a feature or service, information is available to the government (before, during, or immediately after the transfer of such communications) identifying the provider of wire or electronic communication service that has acquired access to the communications.
`Sec. 2603. Notices of capacity requirements
`(a) Notices of Maximum and Initial Capacity Requirements . -
`(1) In general . - Not later than 1 year after the date of enactment of this chapter, and after consulting with State and local law enforcement agencies, telecommunications carriers, providers of telecommunications support services, and manufacturers of telecommunications equipment, the Attorney General shall publish in the Federal Register and provide to appropriate telecommunications carrier associations, standard-setting organizations, and fora -
`(A) notice of the maximum capacity required to accommodate all of the communication interceptions, pen registers, and trap and trace devices that the Attorney General estimates that government agencies authorized to conduct electronic surveillance may conduct and use simultaneously; and
`(B) notice of the number of communication interceptions, pen registers, and trap and trace devices, representing a portion of the maximum capacity set forth under subparagraph (A), that the Attorney General estimates that government agencies authorized to conduct electronic surveillance may conduct and use simultaneously after the date that is 4 years after the date of enactment of this chapter.
`(2) Basis of notices . - The notices issued . under paragraph (1) may be based upon the type of equipment, type of service, number of subscribers, geographic location, or other measure.
`(b) Compliance With Capacity Notices . -
`(1) Initial capacity . - Within 3 years after the publication by the Attorney General of a notice of capacity

requirements or within 4 years after the date of enactment of this chapter, whichever is longer, a telecommunications carrier shall ensure that its systems are capable of -
`(A) expanding to the maximum capacity set forth in the notice under paragraph (1)(A); and
`(B) accommodating simultaneously the number of interceptions, pen registers, and trap and trace devices set forth in the notice under paragraph (1)(B).
`(2) Permanent capacity . - After the date described in paragraph (1), a telecommunications carrier shall ensure that it can accommodate expeditiously any increase in the number of communication interceptions, pen registers, and trap and trace devices that authorized agencies may seek to conduct and use, up to the maximum capacity requirement set forth in the notice under paragraph (1)(A).
`(c) Notices of Increased Maximum Capacity Requirements . -
`(1) The Attorney General shall periodically provide to telecommunications carriers written notice of any necessary increases in the maximum capacity requirement set forth in the notice under subsection (b)(1).
`(2) Within 3 years after receiving written notice of increased capacity requirements under paragraph (1), or within such longer time period as the Attorney General may specify, a telecommunications carrier shall ensure that its systems.
are
capable of expanding to the increased maximum capacity set forth in the notice.
`Sec. 2604. Systems security and integrity
`A telecommunications carrier shall ensure that any court ordered or lawfully authorized interception of communications or access to call-identifying information effected within its switching premises can be activated only with the affirmative intervention of an individual officer or employee of the carrier.
`Sec. 2605. Cooperation of equipment manufacturers and providers of telecommunications support services
`(a) Consultation . - A telecommunications carrier shall consult, as necessary, in a timely fashion with manufacturers of its telecommunications transmission and switching equipment and its providers of telecommunications support services for the purpose of identifying any service or equipment, including hardware and software, that may require modification so as to permit compliance with this chapter.
`(b) Modification of Equipment and Services . - Subject to section 2607(c), a manufacturer of telecommunications transmission or switching equipment and a provider of telecommunications support services shall, on a reasonably timely basis and at a reasonable charge, make available to the telecommunications carriers using its equipment or services such modifications as are necessary to permit such carriers to comply with this chapter.
`Sec. 2606. Technical requirements and standards; extension of

compliance date
`(a) Safe Harbor . -
`(1) Consultation . - To ensure the efficient and
industry-wide implementation of the assistance capability
requirements under section 2602, the Attorney General, in.

coordination with other Federal, State, and local law enforcement
agencies, shall consult with appropriate associations and
standard-setting organizations of the telecommunications industry.
`(2) Compliance under accepted standards . - A
telecommunications carrier shall be found to be in compliance with
the assistance capability requirements under section 2602, and a
manufacturer of telecommunications transmission or switching
equipment or a provider of telecommunications support services
shall be found to be in compliance with section 2605, if the
carrier, manufacturer, or support service provider is in compliance
with publicly available technical requirements or standards are
adopted by an industry association or standard-setting organization
or by the Commission under subsection (b) to meet the requirements
of section 2602.
`(3) Absence of standards . - The absence of technical
requirements or standards for implementing the assistance
capability requirements of section 2602 shall not -
`(A) preclude a carrier, manufacturer, or services
provider from deploying a technology or service; or
`(B) relieve a carrier, manufacturer, or service provider
of the obligations imposed by section 2602 or 2605, as
applicable.
`(b) FCC Authority . -
`(1) In general . - If industry associations or
standard-setting organizations fail to issue technical requirements
or standards or if a government agency or any other person believes
that such requirements or standards are deficient, the agency or
person may petition the Commission to establish, by notice and
comment rulemaking or such other proceedings as the Commission may
.
be authorized to conduct, technical requirements or standards that
-
`(A) meet the assistance capability requirements of
section 2602;
`(B) protect the privacy and security of communications
not authorized to be intercepted; and
`(C) serve the policy of the United States to encourage
the provision of new technologies and services to the
public.
`(2) Transition period . - If an industry technical
requirement or standard is set aside or supplanted as a result of
Commission action under this section, the Commission, after
consultation with the Attorney General, shall establish a
reasonable time and conditions for compliance with and the

transition to any new standard, including defining the obligations
of telecommunications carriers under section 2602 during any
transition period.
`(c) Extension of Compliance Date for Features and Services . -
`(1) Petition . - A telecommunications carrier proposing to
deploy, or having deployed, a feature or service within 4 years
after the date of enactment of this chapter may petition the
Commission for 1 or more extensions of the deadline for complying
with the assistance capability requirements under section 2602.
`(2) Ground for extension . - The Commission may, after
affording a full opportunity for hearing and after consultation
with the Attorney General, grant an extension under this paragraph,
if the Commission determines that compliance with the assistance
capability requirements under section 2602 is not reasonably
achievable through application of technology available within the
compliance period.
`(3) Length of extension . - An exten.
sion under this
paragraph shall extend for no longer than the earlier of -
`(A) the date determined by the Commission as necessary
for the carrier to comply with the assistance capability
requirements under section 2602; or
`(B) the date that is 2 years after the date on which the
extension is granted.
`(4) Applicability of extension . - An extension under this
subsection shall apply to only that part of the carrier`s business
on which the new feature or service is used.
`Sec. 2607. Enforcement orders
`(a) Enforcement by Court Issuing Surveillance Order . - If a
court authorizing an interception under chapter 119, a State
statute, or the Foreign Intelligence Surveillance Act of 1978 (50
U.S.C. 1801 et seq.) or authorizing use of a pen register or a trap
and trace device under chapter 206 or a State statute finds that a
telecommunications carrier has failed to comply with the
requirements in this chapter, the court may direct that the carrier
comply forthwith and may direct that a provider of support services
to the carrier or the manufacturer of the carrier`s transmission or
switching equipment furnish forthwith modifications necessary for
the carrier to comply.
`(b) Enforcement Upon Application by Attorney General . - The
Attorney General may apply to the appropriate United States
district court for, and the United States district courts shall
have jurisdiction to issue, an order directing that a
telecommunications carrier, a manufacturer of telecommunications
transmission or switching equipment, or a provider of
telecommunications support services comply with this chapter.
`(c) Grounds for Issuance . - A court shall issu.
e an order under
subsection (a) or (b) only if the court finds that -
`(1) alternative technologies or capabilities or the

facilities of another carrier are not reasonably available to
law enforcement for implementing the interception of
communications or access to call-identifying information; and
`(2) compliance with the requirements of this chapter is
reasonably achievable through the application of available
technology to the feature or service at issue or would have
been reasonably achievable if timely action had been taken.
`(d) Time for Compliance . - Upon issuance of an enforcement
order under this section, the court shall specify a reasonable time
and conditions for complying with its order, considering the good
faith efforts to comply in a timely manner, any effect on the
carrier`s, manufacturer`s, or service provider`s ability to
continue to do business, the degree of culpability or delay in
undertaking efforts to comply, and such other matters as justice
may require.
`(e) Limitation . - An order under this section may not require
a telecommunications carrier to meet the government`s demand for
interception of communications and acquisition of call-identifying
information to any extent in excess of the capacity for which
notice has been provided under section 2603.
`(f) Civil Penalty . -
`(1) In general . - A court issuing an order under this
section against a telecommunications carrier, a manufacturer of
telecommunications transmission or switching equipment, or a
provider of telecommunications support services may impose a civil
penalty of up to $10,000 per day for each day in violation after
the issuance of the order.
or after such future date as the court
may specify.
`(2) Considerations . - In determining whether to impose a
fine and in determining its amount, the court shall take into
account -
`(A) the nature, circumstances, and extent of the
violation;
`(B) the violator`s ability to pay, the violator`s good
faith efforts to comply in a timely manner, any effect on
the violator`s ability to continue to do business, the
degree of culpability, and the length of any delay in
undertaking efforts to comply; and
`(C) such other matters as justice may require.
`(3) Civil action . - The Attorney General may file a civil
action in the appropriate United States district court to collect,
and the United States district courts shall have jurisdiction to
impose, such fines.
`Sec. 2608. Reimbursement of telecommunications carriers
`(a) In General . - The Attorney General shall, subject to the
availability of appropriations, reimburse telecommunications
carriers for all reasonable costs directly associated with -
`(1) the modifications performed by carriers prior to the
effective date of section 2602 or prior to the expiration of

any extension granted under section 2606(c) to establish the capabilities necessary to comply with section 2602;
`(2) meeting the maximum capacity requirements set forth in the notice under section 2603(a)(1)(A); and
`(3) expanding existing facilities to accommodate simultaneously the number of interceptions, pen registers and trap and trace devices for which notice has been provided under section 2603(a)(1)(B).
`(b) Procedures.
and Regulations . - Notwithstanding any other law, the Attorney General may establish any procedures and regulations deemed necessary to effectuate timely and cost-efficient reimbursement to telecommunications carriers for reimbursable costs incurred under this chapter, under chapters 119 and 121, and under the Foreign Intelligence Surveillance Act of 1978 (50 U.S.C. 1801 et seq.).
`(c) Dispute Resolution . - If there is a dispute between the Attorney General and a telecommunications carrier regarding the amount of reasonable costs to be reimbursed under subsection (b), the dispute shall be resolved and the amount determined in a proceeding initiated at the Commission under section 2606(b) or by the court from which an enforcement order is sought under section 2607.
`(d) Lack of Appropriated Funds . - The lack of appropriated funds sufficient to reimburse telecommunications carriers for modifications under subsection (a) shall be considered by the Commission or a court in determining whether compliance is reasonable under section 2607(c).`.
(b) Technical Amendment . - The part analysis for part I of title 18, United States Code, is amended by inserting after the item relating to chapter 119 the following new item:
`120. Telecommunications carrier assistance to the Government 2601`.
SEC. 2. AUTHORIZATION OF APPROPRIATIONS.
There are authorized to be appropriated to carry out section 2608 of title 18, United States Code, as added by section 1 -
(1) a total of $500,000,000 for fiscal years 1995, 1996, 1997, and 1998; and
(2) such sums as are necessary for each fiscal year thereafte.
r.
SEC. 3. EFFECTIVE DATE.
(a) In General . - Except as provided in paragraph (2), chapter 120 of title 18, United States Code, as added by section 1, shall take effect on the date of enactment of this Act.
(b) Assistance Capability and Systems Security and Integrity Requirements . - Sections 2602 and 2604 of title 18, United States Code, as added by section 1, shall take effect on the date that is 4 years after the date of enactment of this Act.
SEC. 4. REPORTS.

(a) Reports by the Attorney General . -
(1) In general . - On or before November 30, 1995, and on or before November 30 of each year for 5 years thereafter, the Attorney General shall submit to the Congress a report on the amounts paid during the preceding fiscal year in reimbursement to telecommunications carriers under section 2608 of title 18, United States Code, as added by section 1.
(2) Contents . - A report under paragraph (1) shall include -
(A) a detailed accounting of the amounts paid to each carrier and the technology, feature or service for which the amounts were paid; and
(B) projections of the amounts expected to be paid in the current fiscal year, the carriers to which reimbursement is expected to be paid, and the technologies, services, or features for which reimbursement is expected to be paid.
(b) Reports by the Comptroller General . -
(1) In general . - On or before April 1, 1996, and April 1, 1998, the Comptroller General of the United States, after consultation with the Attorney General and the telecommunications industry, shall submit to the Congress a report reflecting its audit of the sum.
s paid by the Attorney General to carriers in reimbursement.
(2) Contents . - A report under paragraph (1) shall include the findings and conclusions of the Comptroller General on the costs to be incurred after the compliance date, including projections of the amounts expected to be incurred and the technologies, services, or features for which expenses are expected to be incurred.
SEC. 5. CORDLESS TELEPHONES.
(a) Definitions . - Section 2510 of title 18, United States Code, is amended -
(1) in paragraph (1) by striking `but such term does not include` and all that follows through `base unit`; and
(2) in paragraph (12) by striking subparagraph (A) and redesignating subparagraphs (B), (C), and (D) as subparagraphs (A), (B), and (C), respectively.
(b) Penalty . - Section 2511 of title 18, United States Code, is amended -
(1) in subsection (4)(b)(i) by inserting `a cordless telephone communication that is transmitted between the cordless telephone handset and the base unit,` after `cellular telephone communication,`; and
(2) in subsection (4)(b)(ii) by inserting `a cordless telephone communication that is transmitted between the cordless telephone handset and the base unit,` after `cellular telephone communication,`.
SEC. 6. RADIO-BASED DATA COMMUNICATIONS.
Section 2510(16) of title 18, United States Code, is amended -

(1) by striking `or` at the end of subparagraph (D);
(2) by inserting `or` at the end of subparagraph (E); and
(3) by inserting after subparagraph (E) the following new subparagraph:
`(F) an electronic communication;`
SEC. 7..
PENALTIES FOR MONITORING RADIO COMMUNICATIONS THAT ARE TRANSMITTED USING MODULATION TECHNIQUES WITH NONPUBLIC PARAMETERS.
Section 2511(4)(b) of title 18, United States Code, is amended by striking `or encrypted, then` and inserting `, encrypted, or transmitted using modulation techniques the essential parameters of which have been withheld from the public with the intention of preserving the privacy of such communication`.
SEC. 8. TECHNICAL CORRECTION.
Section 2511(2)(a)(i) of title 18, United States Code, is amended by striking `used in the transmission of a wire communication` and inserting `used in the transmission of a wire or electronic communication`.
SEC. 9. FRAUDULENT ALTERATION OF COMMERCIAL MOBILE RADIO INSTRUMENTS.
(a) Offense . - Section 1029(a) of title 18, United States Code, is amended -
(1) by striking `or` at the end of paragraph (3); and
(2) by inserting after paragraph (4) the following new paragraphs:
`(5) knowingly and with intent to defraud uses, produces, traffics in, has control or custody of, or possesses a telecommunications instrument that has been modified or altered to obtain unauthorized use of telecommunications services; or
`(6) knowingly and with intent to defraud uses, produces, traffics in, has control or custody of, or possesses -
`(A) a scanning receiver; or
`(B) hardware or software used for altering or modifying telecommunications instruments to obtain unauthorized access to telecommunications services,`.
(b) Penalty . - Section 1029(c)(2) of title 18, United States Code, is amended by strikin.
g `(a)(1) or (a)(4)` and inserting `(a)(1), (4), (5), or (6)`.
(c) Definitions . - Section 1029(e) of title 18, United States Code, is amended -
(1) in paragraph (1) by inserting `electronic serial number, mobile identification number, personal identification number, or other telecommunications service, equipment, or instrument identifier,` after `account number,`;
(2) by striking `and` at the end of paragraph (5);
(3) by striking the period at the end of paragraph (6) and inserting `; and`; and
(4) by adding at the end the following new paragraph:

`(7) the term `scanning receiver` means a device or apparatus
that can be used to intercept a wire or electronic
communication in violation of chapter 119.`.
SEC. 10. TRANSACTIONAL DATA.
(a) Disclosure of Records . - Section 2703 of title 18, United
States Code, is amended -
(1) in subsection (c) -
(A) in subparagraph (B) -
(i) by striking clause (i); and
(ii) by redesignating clauses (ii), (iii), (iv) as
clauses (i), (ii), and (iii), respectively; and
(B) by adding at the end the following new subparagraph:
`(C) A provider of electronic communication service or
remote computing service shall disclose to a governmental
entity the name, billing address, and length of service of
a subscriber to or customer of such service and the types
of services the subscriber or customer utilized, when the
governmental entity uses an administrative subpoena
authorized by a Federal or State statute or a Federal or
State grand jury or trial subpo.
ena or any means available
under subparagraph (B).`; and
(2) by amending the first sentence of subsection (d) to read
as follows: `A court order for disclosure under subsection (b)
or (c) may be issued by any court that is a court of competent
jurisdiction described in section 3126(2)(A) and shall issue
only if the governmental entity offers specific and articulable
facts showing that there are reasonable grounds to believe that
the contents of a wire or electronic communication, or the
records or other information sought, are relevant and material
to an ongoing criminal investigation.`.
(b) Pen Registers and Trap and Trace Devices . - Section 3121 of
title 18, United States Code, is amended -
(1) by redesignating subsection (c) as subsection (d); and
(2) by inserting after subsection (b) the following new
subsection:
`(c) Limitation . - A government agency authorized to install
and use a pen register under this chapter or under State law, shall
use technology reasonably available to it that restricts the
recording or decoding of electronic or other impulses to the
dialing and signalling information utilized in call processing.`.
HR 4922 IH - - 2

]They don't drive by the house at 2 miles per hour anymore either.

Glad they've stopped. Another approach you could take, BTW,
is to find out the cop's name, and call his *wife* and ask if she
knows why her husband is doing that sort of thing to innocent people
(if he's married). It's a bit hostile, but he's apparently not the
type who feels strongly about personal privacy...

In article <33j38v$uk@giga.bga.com>, ares@bga.com (Steve Gibson) says:

>The main thing I learned from this call is that people who aren't
>involved in an incident, especially one like the above, need to stay away
>from the scene. When officers arrive at a call like that EVERYONE is a
>suspect until proven otherwise.

AMEN. Fire Departments have the same problem. In fact, around here, those
who go rushing to the scene of fires or police calls have a special name: BUFFS.

If you are not involved, dont get that way. Police and Fire Depts. have enough
on their hands with the emergency; crowd control takes those who would be
dealing with the emergency away from that duty to make sure YOU aren't part
of the emergency.

So we can be a little more clever at this, where are the police
trunking frequencies supposed to be?

1096. Freqs for SF and The Bay

1097. The scoop on GMRS

Newsgroup: rec.radio.scanner
Date: 1994-08-26 22:35:21 UTC
From: af546@yfn.ysu.edu
Message-ID: <33lqn9$97g@news.ysu.edu>
Source record: 269983

First off message #11962 is totally wrong (Send Mork back to Ork).
There is NO "test " for a license in GMR. Only a FCC Form 574 as required
in most other radio services (Business, Public Safety, Etc.) AND a FEE
which has just been increased.

Requirements are - One must be 18 years of age or older and a U.S citizen.
Exactly as it was for Class D Citizens Radio (CB).

FCC does not care if you wish to use your GMR for either Business and/or
Personal.
All users must be indivualy licensed except grandfathered business and/or
fleet users from a few years back (and folks there are alot of grandfathered
users out there.)
One can legally use GMR for business use, dispatch on, and use this service
just like business radio (just as long as each user has a FCC call sign
issued to their person. (or have
been grandfathered)

Is there any point for getting a "callsign" from CRB? I know that hams get one because it is thier means for identifaction, and to prove that they can indeed be transmitting in the ham bands. But why scannerists? Do you get anything more then a certificate that says you are XXXX?

Just wondering if it would be worth it for me to order such a thing. I have my Ham call in the mail..but some say more the merrier.

1099. Cordless Phones Seized by Serb Police

Newsgroup: rec.radio.scanner
Date: 1994-08-26 22:56:00 UTC
From: nigel.allen@canrem.com
Message-ID: <60.7417.5773.0N1AC049@canrem.com>
Source record: 269991

[This deals with monitoring police calls on cordless phones
rather than purpose-built scanners, but I thought it would be
of interest to readers of this newsgroup.]

Note from NDA: Kosova (sometimes written Kosovo) is a part of
Serbia adjacent to Albania and inhabited mostly by ethnic Albanians.
It is governed as an integral part of Serbia, and the police there are
pretty vicious.

The following article was originally posted to soc.culture.yugoslavia
and soc.culture.europe by cla04@cc.keele.ac.uk (A.T. Fear)

>Subject: News from Kosova
>Date: Mon Aug 22 12:11:02 1994

KOSOVA COMMUNICATION
Bulletin of the Ministry of the Information
of the Republic of Kosova
3rd Year; No 184; 22 August 1994

Serb Police in Mass Telephone Seizures

The presence of cordless telephones in numerous private Albanian
homes has been of great concern to Serbian police authorities with the
revelation that in some cases, police wave bands can be overheard.

Consequently Serbian police have embarked upon a mass search of
Albanian homes throughout communes of Kosova in order to seize
telephones which police believe are being used to eavesdrop on police
communication frequencies. In many cases, families found in
possession of such phones have been subjected to physical
maltreatment.

Incidents of this type have been reported in the communes of Decan
and Kamenica with over 54 telephones seized, each seizure
accompanied by maltreatment of Albanian residents.

Albanians affected by this police action have pointed out that they
had purchased the phones legally and with the full knowledge of Serbian
telecommunication authorities and had paid up to 2,500 DM in order to
be connected.

1100. Hush-Hush on Celluar 911

Newsgroup: rec.radio.scanner
Date: 1994-08-26 22:57:33 UTC
From: af546@yfn.ysu.edu
Message-ID: <33ls0t$9m8@news.ysu.edu>
Source record: 269988

Notice folks that rarely is there talk of free emergency use on each
and every activated or unactivated celluar phone in existance.

In cincinnati, a news story was done on celluar use and a fact that anyone
with a celluar phone could use it in an emergency came up.....The reporter
confronted the celluar carrier when he was building his story and the
representative requested that that info be left out!!!!

Wow.....Now one could look at this in two ways......Either celluar system
operators DO NOT WANT THE GENERAL PUBLIC TO KNOW that one can get a cell
phone from a flea market or what/whereever and use it to call 911 when
they need help. ie. put in in their car for safety reasons or security
AND NOT HAVE TO HAVE IT ACTIVATED and to LEGALLY have this service for
FREE.....

OR maybe with the conjunction of 911 centers across the nation, both celluar
operators and 911 centers don't want this info public to try to keep the
number of prank calls and other forms of abuse to a mimimum.

Correct me if I'm wrong but was'nt there a requirement that if a celluar
system was installed, the operator MUST complete ALL 911 calls?

Was'nt this rule issued for a reason?

SO THEREFORE WHY SHOULD THIS INFORMATION BE COVERED UP1111!!!!!

Well, I have an extremely difficult problem, I can't find any modifiable PRO-43's in my area. This might be of some trouble, but could someone help me buy one? I will pay full price for the unit and any taxes, and shipping. If you can help me, and I know this is a BIG if, please do. I will send you a check for 400 dollars and only ask that you keep 50 percent of the change for your troubles.
if any of you do have a used pro-43, i will only go up to 300 dollars for the unit. it MUST be modifiable. thanks in advance for any help. i would prefer that the used pro-43 be not modified at all so that i can do it myself. call me a stickler to do it yourself. thanks again.
E-mail me if interested, and remember that i will reimburse you for any troubles. BTW, please include sales receipt when sending the unit to me.

*** NEWSFLASH *** URGENT *** FOR IMMEDIATE RELEASE ***

n reviewing the September issue of Monitoring Tis, on page 97, right center, appears the advertisment:

800 MHZ Coverage!
We have scanners with
800 Mhz coverage!
Models available include:
ICOM R-9000, R7100, R7000, R1,
R100, IC-2SRA; Kenwood RZ-1;
Yupitero MVT-7100, MVT-7000,
MVT-8000; Shinwa SR-001;
Bearcat BC200XLT, BC700A, BC760XLT.

ATLANTIC HAM RADIO LTD. 368 Wilson Ave
(416) 636-3636 Downsview, ON
(416) 631-0747 (fax) Canada M3H 1S9

All US orders shipped UPS AIR.

Also appearing to the left of the advertisment is the text:

NOTE ON ADVERTISEMENT AT RIGHT:

As of 4/26/94 it became unlawful to market cellular-capable receivers in the U.S. Atlantic Ham Radio assures us it will give full refund and hold customers harmless from shipping expenses if a purchased unit is returned to the vendor by U.S. Customs.

Now how is that for an advertisement! That is a guarantee you have NOTHING to lose in getting your cellular capable unit from Atlantic! This should remove any doubt from those poor hopeless dealers who no longer have any cellular restorable scanners in stock (I could name quite a few, but I won't).

DO NOT BUY U.S.!, buy the international model from these fine folks, don't be left out with a censored unit with an 800 mhz band full of holes!

This is just the type of advertisment I know some of you have been waiting for, from the questions I receive in e-mail. It appears in the September issue of MT, page 97... if you still doubt it -- go buy a copy today!

[The above was an unsolicited recommendation and quoted advertisement due to its relevancy of obtaining cellular equipment into the U.S. from foreign places, shall we dare call it "importing"? I am in no way related to the company referenced and receive no form of consideration for these statements.]

If you want to read some real funny humour, turn to page 120, the Grove Closing Comments. It seems that Grove is out of cellular restorable scanners like most other places in the U.S. are -- and are crying out for enforcement action on overseas dealers because of their lost sales!

Booo hooo! Here BOB GROVE, HERE'S MY HANKY, CRY ON IT! You could open an office in Canada, ya know!

It was aptly named the Closing Comments, as it might be the Closing of Grove in the future -- since his comments only get worse. This man has gone beyond unreasonable in his attempts to sell you scanners under the guise "when they are gone their will be no more!" Look at the CommTel units in the UK and then say that MR GROVE! One dealer even guarantees delivery or no charge!

GROVE... with your latest B*LLSH*T, I think I can tell you where you can go! Please take the express there, it will be faster -- and the faster the better!

I'm starting to wonder if I made a mistake in extending the subscription last year to 1996, you may not make it that far.

Comments anyone? Read the article, its a riot! Second to last page, September MT!

Not entirely true -- when you use the coupon, they reduce the item
by $2, thereby returning the tax paid -- since the item is then
valued at $2 less, which means the end result is the same.

I'm interested in your findings. In the meanwhile, I've gather
everything to put up an external antenna, all I need now is the actual
antenna! I've ordered the Diamond D130J and it should be here early next
week.

BTW - I went to Ham Radio Outlet and saw that they had the D130J
antenna. The salesperson said that they also had an Icom antenna which
is identical to the Diamond (same manufacturer), but a better deal
because it came with 50 meters of feed line for $10 dollars more! I also
asked how much the Belden 9913 cable was, 69 cents per foot and they do
not build cables (i.e., no soldering).

Message-ID: <009838A4.AA837212@Violet.CCIT.Arizona.EDU>
Source record: 269995

In the Tucson area there are still some left - most at the Fort Worth approved price of $359. Sales tax runs 7% in most of the stores, but at least one, with a 5% sales tax, picked up a 2006 for me from another store, and in addition sold it for $349. At present sales rates, though, they will probably be off the shelves within another week. I ordered the $7.95 manual, as I intend to 'void my warranty' Real Soon Now.

I then called Optoelectronics. They suggested Grove has a large inventory, and if they've raised the price to make a better profit, so what? I was also told Opto will probably raise THEIR price, too, for the 456 computer interface. If they do, maybe they'd be worth copying, instead of buying.

They are 'evaluating' other receivers for 'mod' potential.

Along that line, it may be worth noting that the RS store mgr said earlier in the week he received a call to remove a couple of the newer models from the shelves - they were 'easily modified', and RS is NOT going to take a chance on violating the law regarding the requirement that they be non-modifiable.

I would not assume the "new 1000 channel" will be easily made to cover the cellular frequencies. RS will be violating the letter of the law if they are, and it could cost them a bundle.

Since a computer is needed to operate the Opto interface, I thought I'd pass along the fact that TreDex (Comp Shopper Advertiser) has (had?) some 486DLC25 IBM notebooks, w/ 4meg RAM, 40meg hard drive, 6" LCD VGA mono screen; runs on hydride battery, comes with optional external 3 1/2" drive and an extra battery. Measures only 9" x 5.5" x 1.25". Wireless pen, too! The price - $565. The FAX said it all - "they won't last long"!

>Correct me if I'm wrong but was'nt there a requirement that if a celluar
> system was installed, the operator MUST complete ALL 911 calls?

I am sure that limiting abuse is the reason. Unlike the enhanced 911 service
you likely (but not everywhere) get on your land line, mobile 911 calls give
no indication to the operator of who is calling or where they are.

FYI - all cellular 911 calls in California are answered by the California
Highway Patrol. They answer "Mobile 911" because they are prohibited by law
to indentify themselves as CHP when they answer. They have to transfer you to
city police/fire or county sheriff/fire if you are reporting a problem out
thier "jursidiction". (just gee wiz info for those in CA).

And yes - in most cases, all telephone service providors are prohibited from
blocking 911 calls. We are not permitted to block 911 calls from extentions
on our PBXs - our larger complexes have emergency service numbers for
security, fire and medical but we cannot intercept a 911 call. We have
special call detail recorder (CDR) printers that just look for 911 calls in
case of a "caller that hangs up". This usually happens when someone fat
fingers a long distance call like 9+1+another 1 by mistake and then hangs up.

The only thing a inactive cell phone has is an ESN. You can't identify a
subscriber with just that and you can't tell exactly where they are. Although
if you stay on line long enough that can get a rough idea.

>
They come in handy if you have a crack on your wall that you want to
cover up. If you have a laser printer you could just make one up!!!
Otherwise they don't seem to be of much use. The Ham ticket does
have a use in scanning, some areas were scanners are banned by local
regulations seems to exempt licenced hams, keep that in mind

> SO THEREFORE WHY SHOULD THIS INFORMATION BE COVERED UP1111!!!!!

A lot of the reason it is not more widely publicised is because the average John Q. Citizen does not understand what 911 is actually for. I do some computer work here (Louisville, Jefferson County, Kentucky) for the government offices that over-see 911, so I see a lot of their figures on calls taken and such. The number of people who use 911 to report a dead animal on the side of the road is mind boggling. Then there are calls that are atleast a little bit understandable (but not totally) like a highway light or a stop light out...yes, its a bad situtation, depending on its location, but under **VERY** few circumstances does it actually necessitate the use of 911. Also, a flat tire is not a 911 call, its a AAA call (or what ever flavor of auto club you prefer). This past winter, Louisville was socked in with a heavy snow...a large number of people used 911 to report that their streets had not been plowed yet.

I can't remember exactly how many 911 lines Jefferson County has, but its on the order of 18 or so. On a bad night, they fill up quick. They don't need to have to handle road kill and light out calls. If it is going to be widely publicised that 911 calls on cellular phone are free, then it needs to be equally well publicised what 911 is supposed to be used for.

Also, if you think that all those 911 calls on a cellular phone are truely "free" and the cost is not passed on to the service customers hidden away in miscellanous fees, then you are definately out of touch with how big business works. I don't mind paying a slightly higher bill to cover 911 calls that are truely deserving of emergency status, but I don't feel like I should have to

pay for John Q Cellular-owner to report that there is a Pepsi can laying in the middle of I-264.

'nuff said...

Subject: need NOAA/weather freqs for northwest
Newsgroups: rec.radio.shortwave
Organization: University of North Texas
Summary:
Keywords:

My mother will be taking a 4 week camping trip throughout the northwest
United States and Canada. Because of past experience with storms, and
the current fires, I am giving her my shortwave reciever to take with her.

I would like to get a hold of the NOAA weather freqs of different areas
on the northeast, mainly Washington and Oregon, or other frequencies that
may be of use.

Is there an FTP site or WWW page I can access for them? If not, does
anyone in this group have any they can post or email me?

Any help would be greately appreciated!

Yes, I'm actually going to get to go to the MT convention. It'll be my first time at the convention. The convention happens to fall on the weekend of my anniversary, so it was a good excuse to get out of town with the wife and leave the kids home with grandma for the weekend.

Does anyone know if there's lots of equipment (i.e. books, software, computer-scanner interfaces, etc.) being sold at the convention? I'm busting my butt working overtime so I can bring loads of money to blow on scanner stuff.

Message-ID: <5ca_9408271602@commctr.com>
Source record: 269883

Am planning a trip from Colo Spgs, CO to Omaha/Bellvue, NE in late Sept or early Oct. Does anyone have police/medical/emergency frequencies from here to there that they would like to share? Mostly interested in NE State Patrol and then maybe police/medical in Bellvue.

Any other frequencies that you find interesting from here to there would also be appreciated.

I have most of the ones for Offutt/SAC from Mike Dillon/John Johnson, any ones not listed would be helpful.

Also, what is scanner laws in NE, especially in cars? Do they confiscate what they find?

Thank you in advance !!!!

... I know a good tagline when I steal one.

My 4A3 unit has been modified.
4A3 would put its serial number in the 50ks. Units up to the low 70ks
have been reported modified.

1129. PRO-43: the truth

Newsgroup: rec.radio.scanner
Date: 1994-08-27 16:10:36 UTC
From: jerry@hnrc.tufts.edu
Message-ID: <1994Aug27.111036.2827@hnrc.tufts.edu>
Source record: 270021

Let's settle the PRO-43 question once and for all. The old, modifiable units had the model number 20-300 and the FCC ID AA020-300.

(1) There have been reports that the unmodifiable units have different model numbers and/or FCC IDs. Would someone with a new unit *in hand* settle this?

If the part number and ID did not change . . .

Serial numbers

(2a) What is the greatest serial number that *has* been modified?

(2b) What is the *smallest* serial number that *could not* be modified?

Date of Manufacture

(3a) What is the latest date of manufacture that *has* been modified?

(3b) What is the earliest date that *could not* be modified?

Obviously, only an insider can answer 2x and 3x definitively, but as a group we ought to do a good job of bracketing the answers.

Did the news reporters get tickets as well? My sister is a mass comm major about to graduate and they were told one of the most important tools for a reporter is a scanner.

I have driven to wrecks, arrests, etc., before (I live in a small town with not a lot to do). We stayed on the PUBLIC streets and drove by or watched from PUBLIC parking lots. When the life flight helicopter would make an emergency pickup, we would go to the shopping center and watch. Of course we stayed with the other cars and didn't interfere. I see nothing wrong with watching, as long as you drive by and don't interfere with what the police/fire man is doing. As scanner listeners, we need to use common sense, i.e. stay away from drug busts and fellony stops - the cop doesn't need any thing more to worry about.

I have several friends who are in law enforcement and have a great deal of respect for them. If a cop doesn't want you to watch what is happening, what is he afraid you will see?

Actually, I read a post in alt.2600 that said they were handing out FREE cell-phones somewhere in NY. These phones were only capable of dialing 911 and were being handed out at some park by the mayor and police chief as a promotion to lower crime in the area. Sounds like a good deal to me! Give me a free cell-phone and I would be happy to keep it in the car to call 911 if I saw an accident/crime/whatever.

Does anyone know what happened to Phila Fire Films Group? They used to be on 462.000, but for the last month there has been no sign of them on this freq. Did they move to another freq or go out of business?

> had not been plowed yet.

But, alas, if you use a freeway callbox, or call the CHP through 911, in
California if you say your car has broken down, and then you say you're
an Auto Club member, they will automatically forward your call to the
AAA from the CHP operator, so you can talk to them...
So the CHP = AAA over here.

1136. ftp site for scanner mods?

>Steven

Not entirely true, either.....Some states actually require the buyer to
pay the sales tax on the full amount, and then have the coupons reduce the
price paid. Not too many stores are swift to it, but it is on the books
in many states!

P A I D A D V E R T I S E M E N T*1

You Can Invade Privacy!

It is quick and easy with our Illegal Wiretapping equipment!

Our Triggerfish product is especially helpful in those illegal wiretapping cases. Your risk of getting caught is virtually zero.

The law*2 says we can't advertise wiretapping equipment. We don't care. We know how to make money*3 and that's what counts.

Are you a law enforcement agency that can't get wiretapping authorizations, a private detective, corporate security officer, or individual that wants to know what people are saying on their cellular phones? Then, Triggerfish is for you.

Remember, we at Harris Corporation have tossed the wiretapping law in the trash along with the First Amendment. This advertisement for the Triggerfish wiretapping unit is illegal as well as our sale of the device to you. But what counts is money. Think of all the great applications!

Think about all the people that believe their cell phone calls are private:

* Listen to the ignorant criminals that still use cellular phones for their illegal activities.

* Steal corporate secrets from your competition.

* Spy on the plans of political activists and politicians. Ripe for blackmail material too.

* Get off listening to those who use cellular phones for `phone sex'.

* Hear religious leaders yucking up their molestation of children.

* Penetrate undercover police officers & law enforcement agencies making their secret plans.

Remember, it is illegal for you to use a Harris Corporation Triggerfish, but don't worry -- you won't get caught. IT WIRETAPS CELLULAR PHONES WITHOUT WIRES... it simply sucks the voice and other information out of the ether.

Just punch in your victims cellular phone number and you have instant access to their phone calls for all your malicious, perverted, greedy, and other selfish interests.

The law doesn't matter when we can make money. Buy your Triggerfish now -- so you can start invading someone's privacy today. It's a crime, but it's worth it. We make the money, you get to peek inside the private lives of others.

Harris Corporation technology gives you power over the law and the lives of the victims you can penetrate so easily. Not only can the Triggerfish be fun, but profitable too.

Here is the letter that went to all NESN subscribers. Mine was postmarked 8/23/94:

==========
NORTHEAST SCANNING NEWS
PO BOX 62, GIBBSTOWN,NJ 08207

August 17, 1994

Dear NESN reader:

NESN is going NATIONWIDE!! That's right, we are merging with the fine nationwide scanner publication, NATIONAL SCANNER (formerly NATIONAL SCANNING REPORT). Beginning with the September issue of NatScan, we will be responsible for the addition of an eastern section of the magazine. Our coverage area will now include all the states from Maine to Florida. Central amd Western sections will be added.

I will remain as your editor of NESN. You are to continue sending input to the regular NESN Regional Column Editors or to me. I will be responsible for editing and re-writing of all columns, adding my famous one-liners and space filling illustrations. The annual NESN picnic, scanfest and Spring meetings will continue as always.

NATIONAL SCANNING'S editor-in-chief, Larry Miller, wants the NESN section to continue with the NESN flavor, page style, humor, one-liners, illustrations, etc. With NatScan's much larger nationwide membership, hopefully we will recieve much more input for our columns. I've known Larry since he attended our first NESN Summer Picnicx, and we've been in touch ever since. For many years, we have talked about joining forces, and now we have! (The two "L" "M"'s!) It should be a real ball!

We will now read nationwide news with our regional news. We will have photos, a larger 8" X 10-1/2" format, be the first to hear about Uniden Bearcat scanners, place free ads in the Scanner's Mart, read respected product and publication reviews, with columns by top scanner writers like Gene Hughes, Norm Schrein, Laura Quarantiello, Tom Swisher, Gary Sturm, Steve Donnell, and the two amigos, Les Mattson and Larry Miller.

All current NESN subscribers will be converted over to the NATIONAL SCANNING mailing list, to get one issue of NAtScan for each issue of NESN remaining on their subscription. If you already subscribe to both NESN and NatScan, your NatScan subscription will be increased by the number of issues owed you from your NESN subscription.

Get set for a unique scanning experience..... NESN & NATSCAN.

HAPPY MONITORING!

(signed)
LES MATTSON, Editor

after reading the Larry Magne review of the WJ HF1000 in this month's
MT, I will not believe anything he writes again. I can say
for sure that he is absolutely wrong about the audio int eh HF1000.

For that reason I will take all MT reviews with a grain of salt
especially if Grove is selling the product. Too much infomercialism
in that magazine for my comfort.

-> I am sure that limiting abuse is the reason. Unlike the
-> enhanced 911 service you likely (but not everywhere) get
-> on your land line, mobile 911 calls give no indication
-> to the operator of who is calling or where they are.

*** beep *** wrong. Not only can they read off your phone's
ID, but there is a national database on CD-ROM that identifies
the OWNER of EVERY SINGLE CELLPHONE NUMBER ISSUED. As a matter
of fact, and strange as it may seem, there's also a ROM of all
the non-issued numbers, too. So, only a 'stolen' phone won't
lead right back to it's user.

Back in December I was in a duty free shop in the West Indies and saw a Sony portable that looked like a cross between a scanner and a portable short-wave. I didn't catch the model number, but I remember it said something like "High-Scan" across the speaker. I believe it covered 100kHz to 1GHz continuous, with 999 memories and scan and search functions. I was very impressed but was not in the market at the time.

Now I'm in the market.
I have been unable to locate anything like it in the local electronics stores.

Can someone tell me what the model number is?
Is it still manufactured?
What's it going for in the 'states by mail order? From who?
Anybody have one? Like it?

Thanks

Tim the Enchanter.

1154. Motorola ad shows "Daddy" of cellular phone: ww2 walkie talkie!

Newsgroup: rec.radio.scanner
Date: 1994-08-28 02:37:34 UTC
From: wa2ise@netcom.com
Message-ID: <wa2iseCv84Mn.AHo@netcom.com>
Source record: 269895
Cross-posted to: rec.radio.scanner,alt.dcom.telecom

n interesting ad appears in the Aug 29 '94 issue of _Business Week_ magazine. On page 9. Picture of an old world war 2 walkie talkie next to a cell phone. "The (cell phone make and model #) comes from a long line of heros. Like the original SCR 536 hand-held wireless radio, which cut our boys loose from the wires of war. Lives depended on us then. Busy lives depend on us now. ... The best selling ... cell phones ...

Ad "headline" is: Daddy fought in the war.

Wonder if Motorola is telling us that the cell phone is really just a fancy walkie talkie? And like the ww2 radio, the cell phone is not encrypted? (How could the WW2 radio be encrypted with the vacuum tube technology they had back then, the radio isn't big enough).

I know that in my area, if you have a call that has anything to do with
the police, including public saftey on the roads (traffic lights, large
pieces of trash blocking roads) we have been instructed to call 911. I
guess for awhile there, people were afraid of 911 and using it
incorrectly, and weren't calling it all together in fear of misuse.

>up??? Joe

The AR8000 is quite "clean" as far as intermod and image rejection goes,
according to some big city listeners. It is easily the best handheld that
AOR has put their nameplate onto.

: > valued at $2 less, which means the end result is the same.

: >Steven

: Not entirely true, either.....Some states actually require the buyer to
: pay the sales tax on the full amount, and then have the coupons reduce the
: price paid. Not too many stores are swift to it, but it is on the books
: in many states!

If they are doing that -- it is in violation of Radio Shack policy.

That policy dictates when presented with a coupon from the catalog,
you are to enter the item as normal, use the price change option
and subtract $2, therefore something normally selling for $5.95
is valued at $3.95 and that is all you will get if you wish a
refund later. The tax is always calculated at the end of the listed
prices for what you bought.

You're trying to say that when a store is selling a box of 10 disks
for $8 regular $12, that the tax should be on the $12 for the $8
purchase, right? That's ludicrous and illegal! They should not make
a dime for that which you have not paid!

Reminds me of the newspaper situation in Florida. One Saturday night,
I entered Walgreens, put the amount on the counter as listed on the
paper -- then they expected tax to be paid too. I explained it is
included in the price, and the actual price is less than printed on
it, it is done that way to include the tax because the machines like
round numbers (nickels etc).

I argued LOUD and AT LENGTH with the idiots. I have not done business
with them since. The manager gave me this b*llsh*t about how it's
extra unless you buy it at a machine. Guess what, I LOUDLY slammed
the paper on their counter, said "STUFF THE F*CK*NG PAPER, I'LL GO
FIND A F*CK*NG MACHINE!" I think enough saw the problem to get the
message. Seems to me we need another Boston Tea Party on the Florida
tax on newspapers. I solved the problem another way later -- I
subscribed!

I had a similiar situation in a Publix Supermarket once. Same problem.
Only this time I explained the situation in detail and placed on the

counter the exact listed change on the paper. I stated "I AM NOT GOING TO PAY ON CENT OVER WHAT I'D PAY TO A MACHINE AS MACHINES DO NOT COLLECT TAX, YOU CAN'T EITHER, SINCE I HAVE NO WAY OF KNOWING YOU ACTUALLY SUBMIT THE TAX FROM NEWSPAPERS!"

In any event, I said "Now here is the money, I do not need a receipt, (turning), sir, are you a witness to this payment for this newspaper? [yes, I've seen you pay for it], thank you sir, now I will leave. I picked up my paper, left the money on the counter, and left the store".

Never had a problem after that. They did some sort of adjustment as they knew my recourse was to have a witness observe the payment left on the counter, and then leave with the goods. The one problem was the night they were out... and Walgreens was next door.

To hell with the taxes... I get out of them any chance I get!

Is there a newsgroup for getting around taxes? I despise the taxes as much as the (attempted) scanner bans.

The only good politician is an IMPEACHED politician!

I sort of agree with you, but there are some people who do find the
air band exciting, especially if they may be involved in it (like a
pilot). But most air-to-ground communication is that '128 runway 31 left'
stuff, often said so fast you may not understand it. As far as ads, like
in the Damark catalog, talking about the 'exciting air band', it is
probably pointed at customers who've never had a scanner, or who have
another Damark scanner, but can't scan the 108-137 mhz AM band. The
latter, might be the case, since Damark is known for selling cheap stuff,
like scanners that can only scan a few bands. Anyway, once these
customers 'upgrade', they'll find out how exciting (or unexciting) aircraft
communication is.

Highly improbable of receiving Asia on a scanner. If you buy a
shortwave radio (cheaper than a scanner) you'll get those broadcasts.
Check a shortwave usenet group, for more info on this stuff....

Some folks like them, it gives them some kind of 'license number' to
put on QSL requests, or on thier own QSLs that they send. for that
matter, you could make one up yourself <G>. Way back in the golden
age of CB, I got one of those SSB numbers from CRB. I remember getting
a xeroxed 'Certificate', an ID card, a official appearing car window
placard (US Licensed Radio Operator<!>), and a few other document items.
I thought I got my two bucks worth at least. But the CRB catalog was
the best thing I got out of that deal.

But if you bought a cell phone for cash at some store or flea-market,
and never activated it, calling 911 with them only able to retrieve
the phone's ID/ESN, really wouldn't be much help in tracking down
who made some prank call. On the other hand, stay on the line long
enough, the authorities can quickly pin-point what 'cell site' you're
call is coming from, and start hunting for you in that area. That's
how Al Cowings was partly pinpointed while he drove OJ down L.A.
Freeways.

From what I've heard, the few scanners on the market that can also tune in
the shortwave band, do a lousy job of receiving SW broadcasts (Radio Shack
doesn't sell such a combination radio). You're probably better off buying
of scanner that scanns from 29 Mhz on up, and a shortwave radio, that will
receive broadcasts in the lower bands..

Couldn't they also get the tower info from the signal (I suppose it
can be read directly from the 911 call, but there must be *some*
way to cross reference the phone owner's number with the transmission tower)
D Anyway, from what I understand, the tower can figure out the
position of the phone within about 15 feet. Apparantly, this is
how the cell to cell handoff goes so smoothly. So, what would be the
way to cross reference the owner of the phone with tower info)? Is
n't there some sort of hi-tech auto alarm that tracks your stolen
car using this type of info?

1167. Cellular capable scanners

Newsgroup: rec.radio.scanner
Date: 1994-08-28 05:24:00 UTC
From: chrism7204@aol.com
Message-ID: <33p71g$kle@search01.news.aol.com>
Source record: 269906

I am not convinced that I need to run out and attempt to buy an 800MHz capable scanner just for cellular reception. I own a Pro-37 that apparently has limited 800MHz capability: 806-823 and 851-968 (BTW-it's also missing 175-379 MHZ). What would I gain IF, I repeat IF, I could lay my hands on a Pro 2006 tommorrow? I don't particularly care about listening to personal phone calls but what are the other things that I would be missing out on in the 800MHz frequencies?

Would I be better off just waiting on the new RS models which won't have cell bands? I want to run out and get a 2006 JUST because our damn government (you know, the ones who are representing us in the land of the free and brave) says I can't have one, but the my checking account is saying not so fast! :)

Anyway, will the newer scanners that don't have cellular capability have *everything* else or if not, what will it be missing?

I appreciate it,
Chris

Another note I didn't realize 'till I got my catalog: even though it's a
dollar cheaper this year (I got one for free last year :), NOTE: there are
no coupons inside the catalogs. SO no more of someone's idea of using the
$3 coupon to buy the nex catalog to stock up on $5 and $15 coupons for use...

(still hoping to get updated as a "Preferred Customer" for my 10% off, but
I heard the central office makes that decision, not the local 'Shack)

Sherrod

I love it! Don't know what it's doing in this thread, but I enjoy
anything that helps educate the liberals (and Klinton). Personally, I
beleive that the more evil looking the weapon, the less likely the
chances of having to use it. That goes for so-called assault weapons just
as much as the nuclear stockpile that's kept this country safe for decades.
Deny that!
Peace,

writes:

* FCC does not care if you wish to use your GMR for either Business and/or

* Personal.
* All users must be indivualy licensed except grandfathered business
and/or
* fleet users from a few years back (and folks there are alot of
grandfathered
* users out there.)
*One can legally use GMR for business use, dispatch on, and use this
service
* just like business radio (just as long as each user has a FCC call sign
* issued to their person. (or have been grandfathered)

And what planet did you get your information from, buddy? GMRS licenses are only issued to personal (read individual) users for the past seven years! A personal user can have the immediate members of his/her family living in the same household use the license and they can discuss whatever they want, even if it is business related. BUT NO BUSINESS LICENSES ARE BEING ISSUED! Furthermore, dispatch, etc is considered business use and this is prohibited. You cannot lend your friends a radio under your license and you cannot let your employees use your license.

Furthermore, very few grandfathered business licensees exist in major cities, only rural locations where the system still serves them well. In most major cities, the business licensees have either changed frequencies voluntarily or been foced to move because they wanted to increase their power, change the number of units, or moved their antenna location, all of which are prohibited for the grandfathered business licensees. The other reason business licensees leave the GMRS service is when the FCC cites them for violations of the rules for making the previously mentioned changes illegally, usually on the advise and with the participation of their radio dealer.

If you tell your customers that they can use this service "just like business radio" then God only know what other wrong information you supply them.

Thanks again to all those who responded with frequency listings and
suggestions. The show lasted about 20 minutes and was pretty good considering
I couldn't find parking until the start time of the show. (missed about 5 mins. walking to
the beach) I paid attention moreso to the planes than messing
with the scanner so I stayed on the main air-air/coordination freq. of
141.850 AM. I can still hear the whooosh of the F-16's flying by... ;)

Thanks again for all the responses! Aloha!

In ye olden post tmnichol@nps.navy.mil (Troy M. Nichols) spake...
>I have Heard a lot of talk/discussion about digital and how scanning
>will soon be gone. This is how I see the future:
>Soon companies like Icom, Kenwood, etc will start building digital

Yes, I believe that certain digital xmission methods will be defined as
"unencrypted" and future scanners will receive these modes. Just because
something is digital does not mean it's scrambled. Surely SSB was not
considered scrambled communications when AM was all the rage. However,
we'll have to wait for the various digital modulation schemes to battle
it out before a (de facto) standard emerges. AM stereo schemes still
vary, though it looks like Motorola C-QUAM will win out in this battle.

Hi,
AFAIK, (maybe this has been discussed already) UK (and France) has the cheapest GSM service available (phones and network). As an example in Hong Kong, Motorola 7200 are around HK$ 8800 (1 US$ = 7.73 HK$), Nokia 2110 are around HK$10k. The same phones cost about 150 - 250 GBP (UK) subject to a one year contract, add about 250 to 300 for no contract (usually referred to as ESN free, as the service provider holds it). Most of the world uses GSM, USA, Russia and Japan excepted. Great shame.

There are many major operators (service providers) in the UK, four digital, two analogue. (2 GSM + 2 DSC [like GSM but at 1.8GHz]).

regards
Chun

Triple conversion has nothing to do with intermod immunity per se.

It is more likely that you find cheaper scanners use double conversion.
To keep the costs of those models down, manufacturers don't spend
money to produce receiver front ends with better intermod immunity.

The triple conversion scanners on the market use "up conversion,"
a particular implementation in which the first IF is very
high (e.g., 700 MHz). This improves image rejection by placing
the images far outside the passband of the tuned circuits in the
front end.

If you do the arithmetic, you see that as you lower the IF, the
desired frequency and the image frequency get closer to each other.
In a scanner with an IF of 10.7 MHz, the desired and image frequencies
are 21.4 MHz apart. It's more difficult for a front end filter (usually
the filter between the antenna and the rest of the radio) to accept
one signal and reject the other when they are this close in frequency.

In a scanner with a 700 MHz IF, the desired and image frequencies
are 1400 MHz apart -- and it's a lot easier for the front end filters
to block the image.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

This introduction is intended for people new to the scanning hobby and is oriented to scanning in the USA. It tells where you can buy your first scanner, what features it should have, where to get it repaired if required, how to get frequency information, and mentions a few scanner clubs worth joining.

Why Scanning?

Every day and night, scanner hobbyists are entertained by what they overhear on their radios. Police cars, fire engines, ambulances, armored cars, trains, taxis, airplanes, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Listen in the 46.61 - 49.97 MHz range to your neighbors deal drugs over their cordless telephone, or as their conversations are picked up and transmitted over the airwaves between 49.67 and 49.99 MHz by their sensitive baby monitor intercom.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots.

Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

You can even listen to the order taker's wireless microphone at the local McDonald's restaurant on 154.6 and 35.02 MHz!

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the ECPA. Change is in the wind -- when existing stocks are depleted, it will be illegal for companies to sell scanners which cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have recently enacted laws against listening to cordless phones, but it's currently legal to listen in most states. You can find out about these restrictions in a 39 page paperback, ANARC Guide to U. S. Monitoring Laws, compiled by Frank Terranella, available for $7.50 from ANARC Publications, P.O. Box 462, Northfield, MN 55057.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners bear the Realistic label but are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend AOR brand scanners.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't

make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners almost always provide more audio than portables, and portables are usually more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band unless you live in a very rural area where this band is not used. Usage of the 800 MHz band is growing by leaps and bounds.

If you're not sure whether you'll like scanning, don't want to spend much money, a 16 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often poor.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to most scanner owners.

Currently, the more popular scanners include the Uniden/Bearcat 760XLT (a/k/a 950XLT) and Radio Shack PRO-2006 base/mobiles, and the Uniden/Bearcat 200XLT (a/k/a 205XLT) and Radio Shack PRO-43 portables.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so. Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801, can extend reliable reception to 100 miles or more.

If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be somewhat more prone to lightning strikes because they are not at "DC ground."

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- Marymac Distributing (Katy, TX) sells Radio Shack | scanners at discount, but charges a 20% restocking fee | for returned merchandise. Telephone (800)231-3680 and | (713)392-0747.

- Scanner World (Albany, NY). Telephone (518)436-9606.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Many ham radio dealers, like Amateur Electronics Supply (Milwaukee, WI, (800)558-0411), also sell scanners.

Used scanners may be found at hamfests, flea markets, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

If you are handy with a soldering iron, you may be interested in modifying your scanner to add features or enhance its performance. Be warned this usually voids your warranty. Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

ftp.cs.buffalo.edu
garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and stocks parts for several older models. G & G sometimes buys old scanners, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores.

I also recommend the book, Monitor America, 2nd edition published by SMB Publishing, and available from Grove Enterprises for about $25. This single edition contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more

sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's 168 page Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 6th edition is available from Grove Enterprises for about $19. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and Kneitel's sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. It will likely disappoint experienced scanner hobbyists and is better suited for beginners. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The DOS access software is somewhat | difficult to use and the frequencies are displayed with | annoying leading zeroes.

Grove enterprises sells FCC license information on floppy disks. Disks for each state are sold separately, and the information is basically the same as the FCC "state sort," i.e., transmitter location (state/city), callsign, licensee

name, and type of license. The DOS access software is | easier to use than the PerCon CDROM.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio users to identify their operations with their assigned call letters, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in

1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $24.00 per year, which includes the monthly RCMA Journal, which consists of approximately 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

AOSC questions can also be sent electronically to:

rccons!aosc_hq@telerama.pgh.pa.us or
dave.marshall@f240.n108.z1.fidonet.org.
FidoNet: 1:108/240.0

AOSC also has a MEMBERS & EDITORS Scanner related echo, AOSCNet, distributed via FTN on 6 BBS systems, and via Internet Mailing list. Rick Christian advises these strict rules for the AOSCNet Scanner Radio Echo (as of 2/1/94):

1. No discussion of cellular modifications or discussions on how to monitor cellular transmission.
2. No discussions on topics which would violate the ECPA '84, TDDRA '93, (18 USCA 2510 et seq.) or Communications Act 1934 & 1984 as amended (47 USCA 705), i.e., decoding/reception of paging, cellular, encrypted stuff, descrambling etc..
3. No Aliases.
4. No discussion of Shortwave or Amateur Radio material (except SAREX).

For info on the ECHO only, contact:

R.E. Christian, AOSC PA/AOSCNet Founder
PO BOX 12763,
Pittsburgh PA 15241-0763.

This will send a UUENCODED info packet to you. The file contains an outline of the material you will find in the American Scannergram, the AOSCNet, and an application for membership. (Note: This file will not be sent back to *.fidonet.org addresses.)

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members sometimes sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $10 check, payable to Kim Moran, to:

The Command Post
attn. Kim & Ted Moran
6143 W. Touhy Avenue
Chicago, IL 60646

Many CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

Here is a tentative meeting schedule for the remainder of 1994. All meetings will be held on Saturdays at the Destiny Restaurant, 1440 Rand Road, Des Plaines, IL:

October 15
December 10

Bring a notebook and your appetite.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

I am often asked, "How do you find these frequencies?" Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books

The most convenient source of fire and police frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores for under $10. Police Call is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. Later editions have included a few pages of local airport and nonsensitive federal government frequencies.

I highly recommend Richard Barnett's 1992 book, Monitor | America, published by Scanner Master Corp., and available from Grove Enterprises for about $25. This second edition is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the world's largest scanning club, the Radio Communications Monitoring Association (RCMA). Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Beyond Police Call, available from several sources including Radio Shack, covers the business, schools, and other stations not covered by Police Call, its sister publication. One volume covers the entire USA, but no call signs are shown.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The second edition is about 400 pages and is available from Official Scanner Guide. The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $20. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is the best book in print for this difficult to obtain information.

A more accurate, but smaller and less comprehensive book is Midwest Federal Frequency Directory. It was published in 1986, and copies are getting scarce. Copies may still be available for $10 from Scan America.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells the information on PC floppy disks for each state instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The DOS access software is somewhat difficult to use and the frequencies are displayed with annoying leading zeroes.

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)1. Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'2.

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 95 pages long. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. A recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542
Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

The real challenge is deriving new spectrum usage information. Sometimes it requires several days of

listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

More about sleuthing will be discussed in Part II of this article.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?
Part 2: Sleuthing

by Bob Parnass, AJ9S

Part I of this series discussed how scanner enthusiasts can obtain frequency information from books, government microfiche records, or other listeners. This installment discusses digging up new frequencies on your own.

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto

terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described in Part I of this article, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals

weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

Anybody with enough money can buy a brand new scanner, but you can save lots of money if you get a good deal on a used scanner. Hamfests are probably the best place to find used radios, but you must be familiar with the equipment. Hamfests are repleat with older radios you won't see in today's catalogs.

At last count, there were over 70 scanners and monitor receivers of various brands in my collection. I purchase most of my receivers at hamfests or horsetrade with other radio hobbyists. This article describes a few of the FM receivers in my collection, and is not meant to be complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Several people have been pleased with Electronic Repair Center, in Franklin Park, IL, which repairs scanners for a flat fee. Call them at (708)455-5105 to find out their current rates. G & G Communications (telephone 716-768-8151) is another scanner repair company. This family owned company repairs scanners and stocks parts for several older models. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the Bearcat BCH and BCL models, | did not provide individual channel lockout capability. Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series. Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor

performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Bearcat BC-101, Radio Shack COMP 100, and Tennelec MCP-1, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners |

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

Radio Shack scanners contain a reasonable number of features. All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. A few years ago, the Regency and Bearcat scanner lines were purchased by Uniden, a Japanese company, and production was moved to Asia.

My favorite VHF/UHF receivers are the 300 channel Radio Shack PRO-2004, the newer 400 channel PRO-2005 and PRO-2006, and the ICOM R7000 and R7100. The ICOM models are more "communications receiver" than a conventional scanner.

Other favorites include the Bearcat 300 and 760XLT, Regency M400, and the Regency K500 (predates the M400), all of which include a "service search" feature.

For portable use, I prefer the Radio Shack PRO-43 and Uniden/Bearcat 200XLT.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

ICOM

R-7000: At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator

radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but has better IF filtering and contains front-end circuitry for VHF-low, VHF-high, and UHF bands. No aircraft band coverage. Three crystal filters. Front mount speaker sounds good. No rescan delay.

Bearcat 12 (Electra): One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

BC101 (Electra): First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC220 (Electra): 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): A BC220 but with 40 channels. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding

components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

800XLT (Uniden): 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast.

Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels.

BC100XLT (Uniden): Excellent 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): Excellent 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, | often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of

direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Radio Shack

PRO2004: Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio.

PRO2005: Radio Shack's top of the line scanner for 1989 and scanner of choice. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although there is no mobile mounting bracket available and the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended.

PRO2006: Radio Shack's 1994 top of the line scanner. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended.

PRO34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow

control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO24: Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the | common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in | Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the

rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2526	10	X		yes	yes
FR2526	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

REPAIR TIPS: BEARCAT SCANNER RADIOS |

Copyright 1993, 1994 by Bob Parnass, AJ9S |

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or |
publications which charge for service without permission of
the author. Free distribution is encouraged.]

Introduction |

The original Bearcat scanner line was manufactured by |
Electra of Cumberland, Indiana. In the mid 1980s, Uniden |
bought out the Bearcat scanner line and Uniden's first |
Bearcat scanner was the 800XLT model. |

Most of the models discussed in this article are |
base/mobile units made by Electra during the 1970s and |
1980s. Electra stamped all of its scanners with a |
manufacturing date code on the rear of the cabinet. The |
code is comprised of a single character (C = Cumberland, |
Indiana, P = Puerto Rico), followed by four digits denoting |
year and week the radio was built. For example, "P8422" |
denotes the radio was made in the Puerto Rico factory |
during the 22nd week of 1984.

Schematics and Parts Available |

Schematic diagrams may be obtained from Uniden/Bearcat's |
parts department, (317)842-2483. |

G & G Communications (telephone 716-768-8151) is a family |
owned company which repairs scanners and stocks parts for |
several older models, especially Electra/Bearcat and |
Regency brands. They are located at 9247 Glenwood Drive, |
LeRoy, NY 14482. |

Electronic Repair Centers in Franklin Park, Illinois |
(telephone 708-455-5105) has been repairing Bearcat |
scanners for several years. They charge a flat $45 repair |
rate for programmable and $30 for crystal scanners, and |

shipping is extra. Electronic Repair Centers will fix | Regency scanners if they can obtain the parts. |

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, | BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem. |

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In two of the BC300 scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer | failed, causing the output of the supply to drop below the | level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which

is usually fastened to the metal chassis. The 22uF/16V *
capacitor used for C98 in early BC300s was marginal, and
was replaced with a 47uF/25V capacitor in later units.

I recently replaced the 22 uF capacitor in the switching
power supply stage of a BC210XL which caused the same
symptom. Other capacitors in the switcher stage have
failed. C114, a 4.7 uF/35V tantalum capacitor failed in at
least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier
models. The switching supply stage in the BC250 and
original BC210 is driven by a clock signal derived from a
custom Exar NC57902 divider integrated circuit (designated |
IC6 in the BC250 scanner). I've seen this divider IC fail
in several BC250s, causing a blank display (except for a
decimal point in the BC250's rightmost digit). This custom
IC is no longer available from Uniden. |

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid
frequency displayed on the readout. This condition is
temporarily "cured" by unplugging the AC line cord from the
wall, then replugging it. This condition is symptomatic of
a power supply problem in which Q204, a Texas Instruments
TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. |
Don't try a Radio Shack substitute, it hasn't worked. See
Martin Toomajian's article, "Bearcat 250 Erratic Display
Cure", in January 1987 Monitoring Times. *

A similar problem in the Bearcat 20/20 was discussed
previously in the section on bad solder joints. |

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO
squelch position, actuated by rotating the squelch knob
fully counter clockwise. The BC350 used a separate
pushbutton switch for this purpose. These scanners use a |
flimsy potentiometer (designated R81 in BC300s) internally
mounted on the RF circuit board, to set the level of signal
required to open the squelch when in the AUTO position.
This pot also has an effect on the squelch action in the
non-AUTO mode, and determines at which point the squelch
knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory,
changes in component values due to aging often necessitate
readjustment of this internal pot. Misadjustment of this
pot has been the cause of "no squelch" complaints in two

BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem. |

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition. |

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, | e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board. |

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem. |

Other Problems

Complaints of low audio output and occasional microphonics | in a Uniden/Bearcat 800XLT was caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Regency scanners if they can obtain the parts. |

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, | BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem. |

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In two of the BC300 scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer | failed, causing the output of the supply to drop below the | level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. The 22uF/16V * capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

I recently replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated | IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden. |

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. | Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times. *

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints. |

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a | flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know

if this is a common problem. |

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition. |

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, | e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board. |

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem. |

Other Problems

Complaints of low audio output and occasional microphonics | in a Uniden/Bearcat 800XLT was caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Ab> Sabres and Jedi's and such. I've looked, don't think I haven't looked.
Ab> Thank you for your attenton.
Ab> Matthew D.

Why don't you give Motorola a call, I'm sure they'd sell you the software?
Be aware that Motorola software is copyrighted and you must purchase it
to use it. Any other versions floating around are pirated. Motorola
software is also not very cheap. Your probably looking at a couple of
hundred dollars to buy it. You'll also need a RIB box and cables for
the radio you want to program. These are available from 3rd party
sources.

From: af546@yfn.ysu.edu
Message-ID: <33q8tu$kdi@news.ysu.edu>
Source record: 269828

It is permissable to have each and every employee be individually licensed on GMRS for a smaall business establishment! It is not a cost effective method for larger companies with larger employee base.

There is no law in the GMRS Rules that states that I can't license each and every employee of small businesses to use my repeater. PERIOD.

We are not talking cab companies or delivery services here......

The personal user base on my repeater does not even come close to paying the maintenance and tower costs. So therefore the users who use business use on the "machine" offset most of the cost.

This method is even approved by the Personal Radio Steering Group which is the official lobbyist group to the FCC for GMRS.

You seem to have me mistaken for one who puts a company name on the applicant license form. I'm not that stupid enough to loose the app fee.

By the way.....my personal users get along with my business users and vice versa along with other users on the channel nearby QUITE WELL!

Furthermore, out of 14 personal users and 16 business users......
50 percent (yes 8 business users) have been around long enough to be
grandfathered. Now thats in metro Cincinnati on one frequency pair.

I got the statistics on the others both here in Cincinnati and Dayton.

Should I go on?

Personal users CAN NOT for the norm support a money guzzling repeater
that incurrs major expense for great distances. Many even are much later
in paying their support where as business individual users have the
company pay their share of usage because they can't do without it

From: dra@pipeline.com
Message-ID: <33qp9r$fm4@pipe1.pipeline.com>
Source record: 269836

Got letter from Les Mattson, head of NortEast Scanning News dated August 17th announcing that "NESN is going nationwide." Effective with September issue, NESN will be part of "National Scanner" (formerly the National Scanning Report." NESN will be responsible for all east coast coverage in the magazine, from Maine to Florida.

Current NESN members will be converted over to the National Scanning mailing list; those who already subscribe to both will have their subs extended proportionately.

Judging from some strange items in past couple issues of NESN, it looked like they were in trouble and possibly on the verge of going out of existence. Now, it appears they're no longer a 'club' (I an /was?/ member NYNY01), and are becoming part of a commercial publication. I've known "National Scanning Report" editor Larry Miller for quite a number of years...and subscribed/contributed to some of his past publications which went out of business. I subscribed to National Scanning Report, and it suddenly just stopped arriving. It was not considered a major loss; it was awful amaterurish for a commercial publication which appeared, to me at least, to be subsidized by Bearcat.

Comments?

My question is really very basic.Who paid for this activty?And who
authorized the funds to pay for this activity?If I were a taxpayer
in your district I would certainly be OUTRAGED at this WASTE of
public funds.I bet there are many more usefull purposes you could
have found for the funds,such as equipment purchases,training,and
equipment maintenence.My feelings right now are the chiefs of any of the
represented agencies should at the very least,resign,and at the most
face criminal prosecution for improper use of funds if they were
aware of this activity ahead of time!Perhaps some investigation of this
activity is in order!

Articles on the abundant of disconnected cell phones out there have gone into detail of interviewing used car dealers TO FIND OUT HOW MANY CELL PHONES WERE LEFT IN VEHICLES TRADED IN. Interviews show the customer did not want to incur the cost of switching over the phone to their new car. Dealers had so many cell phones laying around that after giving them out to their friends and family, they found individuals willing to buy them at bulk just by calling them up.

I would not invest in any CD ROM that carried this amount of inaccuracy especially after seeing the many gimmicks used just to get cell phones in the publics hands

Steven,

Bob doesn't say whether HE is one of the retailers that complained. HE DID allow the ad for Atlantic to be printed in MT. He couldn't open an office in Canada for selling the radios, unless he was willing to close all of his US operations, or else it would still be a US company or parent company that was breaking the law.

Sure Bob has published some info about the Pro2006 that didn't pan out, and has used the hard sell on the modifiables, but you said yourself that you got a lot of mail from folks about cell capable units. It sounds like he was just making the best out of a situation he himself says is bad.(the so called privacy laws.)

Reread the article again, and if it still reads the same to you, then I don't see what the BS you claim exists, is all about. If you have nifo to the effect that Bob or Grove is one of the retailers that complained to the FCC or Customs, please share it.

Edward

1215. No more ALT.RADIO.SCANNER

Newsgroup: rec.radio.scanner
Date: 1994-08-29 02:18:06 UTC
From: shawn4sk1@aol.com
Message-ID: <33rggu$8nj@search01.news.aol.com>
Source record: 269854

I know this has been debated about before and I'll probably get myself flamed to death before it's all over with but if I cared, I wouldn't have posted this. I also don't have any intentions of reading anyone's "Who cares, why discuss it, it's not important to me..." responses to me anyway, so here goes:

From now on I plan to only read and post to REC.RADIO.SCANNER. There are twice as many postings on it in one day than on ALT.RADIO.SCANNER- I don't see the need to see the same half a dozen messages twice when people cross-post (I've been guilty of it myself) knowing most of us check out both places anyway. This way if people know we're only going to support REC.RADIO.SCANNER, the other will slowly fade away and we can all condense our efforts into one big happy family. :-)

What do you say? Are you with me? Well, I'm with me...it'll sure cut down on AOL time and save my $$$. Good Luck! :-)

on scanner stuff.

Yes, there will be an exhibit hall full of vendors just waiting the
separate your money from your wallet. NE Aerial Development should have
lots of aviation related maps and books, and I know that Opto and ScanStar
will also have their interface products for sale.

Is your wife going to attend the sessions, and the banquet also ?(and does
she have a sister?<g>)

When I go to the airport to see someone off, I hand it to the guard as I walk through. She then asks me to break the squelch to show it works. No problem.

When I travel, I keep my scanners and HT in a bag that does go through the x-ray machine. I have never had any problems, but I did see a post about the x-rays scrambling the EEPROM chip and the owner had to re-enter all of the freqs. This is up to you. Do at your own risk.

: cities, only rural locations where the system still serves them well. In
: most major cities, the business licensees have either changed frequencies
: voluntarily or been foced to move because they wanted to increase their
: power, change the number of units, or moved their antenna location, all of
: which are prohibited for the grandfathered business licensees. The other
: reason business licensees leave the GMRS service is when the FCC cites
: them for violations of the rules for making the previously mentioned
: changes illegally, usually on the advise and with the participation of
: their radio dealer.

I wish this were true.

Most of what I hear on GMRS in the Colorado Springs and the Denver
area is dominated by business users (which I assume were grandfathered
in years ago). The number of "personal" users is quite small or they
don't seem to be on the air much. Of course, its hard to compete
with the air time of businesses like security guards, etc.

I had a whole pile of reported Blue Angel freqs. The only score was at
251.6 which seemed to be in use during some of the formation displays...
im sure ther must be more active freqs, but thats the one i listened to...

the transmissions consisted mostly of reading off of numbers and instructions
like "a little more power". Of course as they pass overhead it was impossible
to hear much of anything anyhow. Id have enjoyed the show if i were deaf!

: You Can Invade Privacy!

: It is quick and easy with our Illegal Wiretapping equipment!

I have seen the ad reprinted in Full DIsclosure 28 and it seems to me
that Harris Co. is making a misrepresentation. It seems like such a
device would only work over a very small area (the area no greater than
the distance between any two cellsites that are using the same
broadcast freq). Further, within that area, unless all of the control
channels were being monitored, a person using a cellular would have
toppass within that particular cell to be monitored. So if someone was
several miles away the device would be useless. In LA one would have
to have dozens of the units scattered throughout the city just to have
a high degree of probability of hearing most of a person's calls. Further,
they advertise that the device sees what a person is calling. I suppose if
you happened to pass within a few blocks of the person when they initiated
their calls, you might get the DNR list they advertise. But for the most
part I think it would be useless for this purpose unless the cops were
goint to use it on a stakeout. Yet the ads make it seem as if it is
the cellular equivalent of a tap on a landline phone and this is just
not technologically possible. The real gall is when Harris suggests that
increased forfeitures of suspects assets will more than pay for the cost
of the unit.

Yes, the 39 is dual-conversion. I owned one for about 24 hours, and
noticing the tremendously BOGUS image problems (crystal clear cellular
junk in the 850-865 range) I brought it back pronto. I was lucky enough
to find a local RS with two old "realistic" labelled 43's (minus the 'A'
at the head of the serial number) in stock and snatched one up.

... stuff deleted ...

I don't think any of that makes any difference... both versions of
the 43 have the same model number and FCC ID.

The UN-modifiable versions of the Pro43 are labelled "Radio Shack"
(NOT "Realistic") on the box -and- on the silk-screen at the bottom
of the rig -and- their serial numbers begin with the letter 'A'.

The modifiable versions of the Pro43 are labelled "Realistic" on
the box -and- the silk-screen at the bottom of the rig -and- their
serial numbers do NOT contain a leading 'A'.

Reminder: This thread is an open-ended political discussion, not an article about shortwave radio. Please don't cross-post this thread to rec.radio.shortwave anymore.

If you are unfamiliar with such things as editing headers to avoid cross-posts, I recommend that you read messages in news.announce.newusers. Cross-posting to many newsgroups is generally frowned upon because it leads to numerous followups that aren't relevant to every newsgroup the message was originally posted to.

Cross-posting from groups in the "talk.*" hierarchy is to be avoided in particular. That hierarchy exists for discussion of topics that are known to generate long and voluminous threads. Folks interested in those threads can subscribe to those newsgroups; folks not interested in those threads shouldn't need to wade through them when they're cross-posted to other newsgroups.

>Anybody have one? Like it?
>
I think your memory is faulty. Sony makes two models that might be labeled
"HISCAN" - ICF-PRO70 and ICF-PRO80. They are continuous coverage in the
baseband (150kHz to 108MHz) and add extended coverage through a down converter
(115.15MHz to 223 MHz). All modes are supported (AM wideband, AM narrowband,
FM wideband, FM narrowband, SSB). The unit does scan and has 40 memories
(4 banks of 10). Lowest frequencies are supported through an internal
ferrite antenna (150kHz to 1.602MHz). Shortwave sensitivity is very good.

The down converter scheme provides for the use of other frequency shifts
through a user programmable offset, but I've not encountered baseband
converters for higher bands (e.g., shifting 400MHz to 150kHz).

The radio works very well, is extremely rugged, and is popular among
aircraft users. I use mine every day. It is also very user unfriendly.
Manufacturing started in 1987.

Officially, they have gone out of business. Jim Bonner, its owner, posted a message on his BBS the other day. I will not reiterate his statements here.

Jim is going back into the still photo business after 19 years as PFF. I would imagine he has no need for his radio system anymore, but don't be surprised if he shows up somewhere.

1237. NESN MERGE WITH NATIONAL SCANNER

Newsgroup: rec.radio.scanner
Date: 1994-08-29 07:13:04 UTC
From: scan911@aol.com
Message-ID: <33s1q0$dgv@search01.news.aol.com>
Source record: 269872

August 24, 1994

To all NESN column editors and other interested parties:

First I want to apologize for the last message/letter I sent out. While I talked of starting up a new publication to replace NESN in the Northeast, I also had a better offer on the table at the time but was unable to discuss it at the time.

Since we learned that NESN was to merge into National Scanning Report, I have been in contact on a daily basis with Dave Marshall, managing editor of the All Ohio Scanner Club's newsletter, American Scannergram. While I have told some of you this already, Dave proposed that the AOSC's newsletter be expanded to include the Northeast states covered in NESN. AOSC already covers an area from Illinois to Pennsylvania and Ontario to Kentucky. It also has many of the columns that NESN had, but now has eliminated to fit within the confines of the 16 pages of NatScan that it has been allocated. In fact, the regional columns are about the only columns that we know NESN will continue.

Many of us are disgruntled that Les Mattson sold NESN to NatScan. There's nothing we can do at this point other than to complain. I am very happy that the All Ohio Scanner Club took NESN members into consideration in deciding to expand their newsletter to accommodate the Northeast. We considered NESN a great scanner club (even though it technically wasn't a club) and AOSC likewise is a great scanner club. The club already has more than 100 members in the NESN territory. I am convinced that AOSC will provide the information we have come to crave from NESN.

At this time, Dave Marshall is looking for editors to handle the new columns in the American Scannergram. If you edited a column for NESN, you have first crack at the new columns to appear in AOSC. The club already has a Pennsylvania editor, but will be looking for editors to handle the following columns at the least: DE-DC-MD-VA, NC, NY-NJ and New England. As we gain new members within AOSC and the member numbers bear it out, some of these columns may be split into separate columns in the future. The actual new columns that will appear in the American Scannergram will be decided within the next month or so.

The current timetable for AOSC calls for telling its members about NESN folding into NatScan in its November-December issue. It will announce in its January-February issue that the club will officially expand into the Northeast and the new Northeast columns will begin

appearing in AOSC in the March-April issue.

If you are interested in writing one of the new columns for the All Ohio Scanner Club, you must contact Dave Marshall now. His Internet address is davem0911@aol.com. His address is 50 Villa Road, Springfield, OH 45503-1036. To serve as an AOSC editor, you must be able to send your columns to Dave via e-mail or in ASCII or WordPerfect 5.1 formats on a diskette. Membership is $18 for your first year in AOSC and $17 for annual renewals. A membership application is attached for your convenience. Of course, you must be a member to serve as an AOSC editor. Those who serve as editors, however, have their membership dues frozen while they serve as editor and their dues already paid resume when they quit their columns. They essentially get their membership for free while serving as an editor. Editors receive their newsletters via first class mail, too. Sample copies of the newsletter, which is the same size and format as NESN, are available for $3 from Dave Marshall. The September-October issue of the American Scannergram will be mailed out next week.

AOSC is an established club and has been a full member of ANARC. It has excellent column editors and is ready to jump in and fill the void created by NESN folding into NatScan. It keeps the sense of a club in the Northeast alive for scanner hobbyists. We hope that you will not only consider joining AOSC, but also consider applying to edit one of the new columns in the American Scannergram.

If you have any questions about this move to keep a scanner club alive in the Northeast, feel free to contact me via Internet e-mail at scan911@aol.com. If you don't have access to a photocopier and need more AOSC membership applications,
let me know and I'll get them to you. Let's show the All Ohio Scanner Club our gratitude and join their organization. It's a great thing that will get greater!

I appreciate those of you have maintained contact with me during this interim period. Please stay in touch.

73,
Chuck Gysi, N2DUP

Member info on ALL OHIO SCANNER CLUB, which is expanding into the NORTHEAST....

AMERICAN SCANNERGRAM
Serving Ohio and the Surrounding Areas With the Most Up To Date Radio Monitoring Information That Is Available!
Official Publication of the
ALL OHIO SCANNER CLUB 50 VILLA ROAD, SPRINGFIELD, OHIO 45503-1036

The ALL OHIO SCANNER CLUB is a not-for-profit organization that is dedicated to sharing information and improving the hobby of monitoring radio communications. The AOSC newsletter is staffed by a group of dedicated volunteers who work together to publish a top notch information exchange and reference source for our members.

The AOSC was founded in 1979 by a scanner enthusiast who wanted to aid in bringing together people interested in the same hobby and to share information such as frequencies, codes, and technical knowledge that is helpful to the hobbyist. Since then, the AOSC has grown to include hundreds of members in over 40 States and Canada, and the newsletter has grown from a mimeographed single sheet to newsletters averaging 40 pages or more that are professionally printed and bound.

The ALL OHIO SCANNER CLUB publishes an information exchange newsletter, called the "AMERICAN SCANNERGRAM", every two months for club members. The newsletter includes regional public safety columns covering all of Ohio, plus Illinois, Indiana, Kentucky, Michigan, Pennsylvania, West Virginia, Ontario, and other areas of North America as well. Other columns include subjects of special interest such as state government; business; sports, including major league baseball and football, auto racing; special events; tourist attractions; aviation, railroads, and other modes of transportation; technical topics; articles about antennas and improved reception techniques; articles to help the beginners in the hobby; understanding public safety communications; and two no-holds-barred columns covering Federal Government, and U.S. Military services. Many of these columns of special interest topics provide nationwide coverage. Also included are columns covering amateur radio; new licenses from the files of the FCC; shortwave utilities; shortwave broadcast; new product and book reviews; and other features. All of these columns are based on information sent in for publication by club members such as yourself. We are an all volunteer organization, no one receives payment for material

written for our publication.

The cost of membership in the ALL OHIO SCANNER CLUB is $18.00 per year ($21.00 for Canadian and Mexican residents, $28.00 for all other countries), payable in U.S. Funds. Membership dues are non-refundable. (A newsletter sample copy is available for $3.00). New members will receive a booklet containing general information about the club; frequencies, codes, and other statewide information for Illinois, Indiana, Kentucky, Michigan, Ohio, Pennsylvania, West Virginia, and Ontario, Canada. Your membership will begin with the next regular mailing of the club newsletter, and will expire after you have received six issues. We print the American Scannergram every other month. Issues are normally mailed by third class bulk rate the last week of February, April, June, August, October, and December.

The AOSC holds an annual family-style picnic and business meeting (if necessary) at a private park shelter in the Columbus, Ohio area. The AOSC hosts a booth for all Association of North American Radio Clubs at the Dayton Hamvention in Dayton Ohio each year (normally the last weekend of April), and also participates in the Winter SWL Festival in Kulpsville, PA the second weekend of March every year and the Monitoring Times Convention (to be held in Atlanta, GA the first weekend of October this year). At the Dayton Hamvention, The AOSC co-sponsors a forum for shortwave and scanner listeners. A social gathering and meeting for AOSC members is also scheduled each year during each of these events. The AOSC also sponsors a net on a Dayton, Ohio area amateur radio repeater for scanner and shortwave listeners.

The AOSC can be reached on America Online or any other online service with an Internet gateway by leaving a message for Dave Marshall at davem0911@aol.com.

Why not join today by filling in the information below and include it with your check or money order (no cash, please) and send it to the address above, and you will become part of the growing group of scanner buffs that are "in the know".

>Bull. Program the frequency of your favorite repeater into one channel of
>your scanner. It is now "amateur equipment."

>And the local cop doesn't get to decide if it is or if it isn't. You have
>a FEDERAL license for amateur radio equipment, and the FEDERAL rules
>pre-empt the state or local rules.

>And you don't even have to learn morse code. . . .

The law / exemption specifically mentions transcievers. That lets out
scanners license or no. With an attitude like yours you will most likely
get to explain it all to the judge. Lighten up and use lots of greasey "yes
sir"s and you will have a lot less problems. There is a lot of trouble that
can and will find you without having to go out of your way to find it.

Well, I went into my local $hack, when I went to purchase my catalog, so I could get the coupon, and use it immediately for some other things I wanted, the salesclerk said that it was free. She said that they (the store) figured that why bother charging for the catalog, when they could just take the coupons off the catalogs, and (I presume) send them to R-$hack Headquarter$ for store credit.

From: feustel@netcom.com
Message-ID: <feustelCvAMG2.5CK@netcom.com>
Source record: 269780

P A I D A D V E R T I S E M E N T*1

You Can Invade Privacy!

It is quick and easy with our Illegal Wiretapping equipment!

Our Triggerfish product is especially helpful in those illegal wiretapping cases. Your risk of getting caught is virtually zero.

The law*2 says we can't advertise wiretapping equipment. We don't care. We know how to make money*3 and that's what counts.

Are you a law enforcement agency that can't get wiretapping authorizations, a private detective, corporate security officer, or individual that wants to know what people are saying on their cellular phones? Then, Triggerfish is for you.

Remember, we at Harris Corporation have tossed the wiretapping law in the trash along with the First Amendment. This advertisement for the Triggerfish wiretapping unit is illegal as well as our sale of the device to you. But what counts is money. Think of all the great applications!

Think about all the people that believe their cell phone calls are private:

* Listen to the ignorant criminals that still use cellular phones for their illegal activities.

* Steal corporate secrets from your competition.

* Spy on the plans of political activists and politicians. Ripe for blackmail material too.

* Get off listening to those who use cellular phones for `phone sex'.

* Hear religious leaders yucking up their molestation of children.

* Penetrate undercover police officers & law enforcement agencies making their secret plans.

Remember, it is illegal for you to use a Harris Corporation Triggerfish, but don't worry -- you won't get caught. IT WIRETAPS CELLULAR PHONES WITHOUT WIRES... it simply sucks the voice and other information out of the ether.

Just punch in your victims cellular phone number and you have instant access to their phone calls for all your malicious, perverted, greedy, and other selfish interests.

The law doesn't matter when we can make money. Buy your Triggerfish now -- so you can start invading someone's privacy today. It's a crime, but it's worth

it. We make the money, you get to peek inside the private lives of others.

Harris Corporation technology gives you power over the law and the lives of the victims you can penetrate so easily. Not only can the Triggerfish be fun, but profitable too.

Harris Corporation, P.O. Box 91000, Melbourne, FL 32902

*1 Remitted directly to the Devil!

*2 18 USC 2500 et. seq.

*3 Our gross revenues in 1991 exceeded $3 billion dollars and we're on the Fortune 200 list.

FUN -- ILLEGAL -- PROFITABLE

>of the emergency.
>

This reminds me of the time I lived in Cleveland. It was late on a
Saturday night. I was just getting ready for bed. When I went to close
the front door, I heard a car screech to a stop. I looked outside and
saw someone in a small pickup stop next to a car parked on the street.
Next the passenger threw something in the driver side window. The
pickup took off and in about a second, the parked car blew up. I called
911 and the fire dept. was there in a flash. They had the fire out in
seconds. I went out and told one of the firemen what I saw. He made me
feel like I was a jerk and was intruding. Like I said, it was late and
I was the only one outside. I vowed never again to get involved. I have
had other chances, but haven't. I have since moved to the burbs.

Try listening between 128 - 130 Mhz. Most aircraft call their respective companies to report 'technical' problems. I've heard everything from loss of oil pressure to engines, severe engine vibration, and complete engine shutdown. Give it a try.

The unrestricted 'free 911' call was came about due to a law suit
several years ago. I forget the particulars but I recall it involved
an individuals cell-phone being wrongfully deactivated in a time of
emergency...

I went out and purchased a full 800Mhz capable Pro-2006 scanner
mostly out of a desire to upgrade my scanning capablilties (last scanner
purchased 8 years ago). I was initially motivated to buy these due to
the new restrictions but truthfully, I don't even bother listening to the
cell freqs'; much more interesting comm's to listen to elsewhere. What
did appeal to me were the features of the scanners; fast scan/search speeds
and memory. The new scanners w/o direct cellular capabilities will offer
even faster scan/search speeds and better performance (triple conversion),
lots of memory, and other features. The 2006 will have a good resale value
for those wanting full 800Mhz capabilities. I personally like the receiver
performance of the 2006 and think it was worth the price.

: Uh, I think that was meant as a joke Ron.

No, not at all. Harris Corporation threatened me with civil and criminal
action for an article I wrote (1 paragraph) about the Triggerfish in issue
No. 24. So, in No 28, I published my "parody" ad, as well as a reprint of
Harris Corporation's slick, glossy brochure (from whish Ron quotes). What
is most significant, is that Harris Corporation claims that my short article
in No. 24 was an ADVERTISEMENT, and that I committed a FELONY by advertising
their product, in that the Wiretapping Statute prohibits the advertisement of
wiretapping devices... YET... they print and distribute SLICK GLOSSY
ADVERTISEMENTS themselves.

I remember seeing a response to this saying it was less sensitive
so you could attach a larger antenna. I was wondering, just how large of
an antenna do you need to compensate? I just got my Pro-2006 Friday. With
a center loaded antenna attached (at right angles, I did have a connector :-)
and testing with the ATT switch in both positions, its reception was still
noticeably worse than my Pro-43 with rubber duckie.
I was picking up CU Campus police at 155.XXX Mhz about 15 miles
away.
Do I need the 30' tower to get similar reception?

The Oceanside and Rancho California offices (covering from north of San Diego city to the Orange County line on the coast, and the Temecula, Rancho California area inland) are on the Tan (42.4200 base, I'm not sure of the mobile) now. The Gold is used by the El Cajon office and covers east of San Diego city to Imperial County and the mountain/desert area.

Well I went out yesterday and got my first scanner, the PRO-51 on sale at radio shack. I lucked out because the sale ended on saturday but since they didn't remove the sale tag I got it at the 199.99 price (maybe a radio shack sales ploy?) Anyway I did the 2, 9, Lockout keycom and put the upper and lower limit cell freqs in just to have :) and put the mid range 50 to 60 and 88 mhz in. Now come the questions, first can I in anyway set the limit scan to scan the cell feq now that they are prog into channels and can some point me in the direction of a list of freq divisions by the FCC, especially the location of cordless phone freqs

"
I don't think any of that makes any difference... both versions
of the 43 have the same model number and FCC ID.
The UN-modifiable versions of the Pro43 are labelled "Radio
Shack" (NOT "Realistic") on the box -and- on the silk-screen at
the bottom of the rig -and- their serial numbers begin with the
letter 'A'.
The modifiable versions of the Pro43 are labelled "Realistic" on
the box -and- the silk-screen at the bottom of the rig -and-
their serial numbers do NOT contain a leading 'A'.
- Mike (N9EUZ)

Mike,
I know for certain your information IS NOT CORRECT. Many
conflicting messages like this caused me to try the hardware mod
just to see who was right. My 43 says RADIO SHACK on it. It has
a prefix of A in the FCC-ID, It has the 3A4 datecode. To find
out for sure, I did the mod myself on my unit, found it worked
and then put the diode back <g>.

: can also be used to hear CW.

To which _I_ reply:

Don't forget 50.1 MHz. > Up (usually 50.1 to about 50.3),
particularly the weekend of 10-11 September, starting at
about 1800Z Saturday and going through 0300Z Monday for the
ARRL VHF Contest. Even though Gary is in the UK, there is a
fair amount of activity on the 6 Meter, er, Metre band in
Europe, most of it between 50.0 and 50.5 or so. (Maybe some-
one local over there can give us more details?).

Also, to amplify Gordon's comments, much of the SSB activity
will be found in 144.1 to 144.3 or so (and CW from 144.0 to
144.1), as well as up around 145.7-145.9 roughly, which is
where you might hear the downlinks from amateur satellites!

On the 70cm band (420-450 MHz. in the Americas, 430-450 in the rest of the world), most of the SSB and CW activity is around 432.0-432.5 and there is satellite activity from 435-438 MHz.

On occasion, some interesting propagation phenomena can occur, which can make for some mighty interesting listening. You might already be familiar with it from scanning FM frequencies, but there are a number of amateur beacons stations all over Europe which use CW or SSB, which you'd miss if you were just using FM.

You might want to poke around in the rec.radio.amateur.* newsgroups to get more information, particularly specifics from hams in your area.

>the Indy race and want to use it there. In particular, do the Canadian
>border people have any restrictions?
>
>

I can't answer the question directly from a Customs/border point, but perhaps the following will help.

The rules in Canada are not as severe as in the U.S.A. with respect to scanners and the cellular bands. The Criminal Code was amended about two years ago to make it a crime for anyone to intercept a radio-based telephone communication, maliciously, or for gain. There are no rules that prohibit sale of scanners that cover the cellular bands.

Like a number of regulations, this one is unenforceable and is impossible to monitor (pun intended), unless one is dumb enough to do something "maliciously, or for gain. That would mean, of course, that the person went public with the information. I suppose that they're out there!

It seems from this post that unmodifiable units have serial numbers starting with A. Has anyone held such a unit in his or her hands? The "Radio Shack" label may be irrelevant. I have *seen* such units with a manufacture date of 12A3 and no A in the serial number and have *heard* of such units with manufacture dates of 9A3.

Source record: 269804

In Los Angeles and I would guess in most of the state of California the freeway call boxes connect to the local Highway patrol 911 operators. If you use them for a service call the 911 operator will transfer the call to a local towing provider. This does NOT mean AAA will always get the call If you say that you are a AAA member the 911 operator will foward the call to AAA. My understanding is that the Highway patrol wants you off the freeway as quickly (and safely) as possible. But, AAA does NOT have monopoly on providing freeway service. I am not sure if this is true in other parts of the state, but in Los Angeles, they have roving tow trucks that will assist you off the freeway as a service from the city or county.

BTW: LA Cellular and I'm sure other cellular services provide a "*" service. with LA Cellular you can dial "*222" (*AAA) and reach the AAA roadside assistance dispatch operator.

For those who have seen various prices above $300 for the PRO-2006:

At the Ithaca, NY hamfest on August 13, the local Radio Shack store had four
PRO-2006's priced at $199.95! They were new in the box, with full warranties.
They were doing this as a Hamfest special. Needless to say, they sold out
10 minutes after they announced the price on the PA. I bought one, figuring
that even if I didn't like it, selling it would be no problem. I do like
it, so don't ask to buy it. Yes, I do have an official Radio Shack receipt
that shows the catalog number and price. Why they blew it out so cheaply
is anyone's guess. I think they could have gotten a lot more, at least
if the letters in this group are any indication.

The 2006 defaults to 30Khz steps in the two cell bands after modification. You may have to hit the reset to activate it the first time.

Must not be a company-owned store. Must be a franchise that could pull
that off. HQ would be all over their own stores if the computer didn't
see them selling the catalog.

Great idea.....if you want a catalog....go to a franchise store. Tell
them to keep the coupon and give you the catalog for free. WOW!

> with a new unit *in hand* settle this?
>

I compared the last two units in stock at my local Radio Shack. One had the FCC-ID: AA020-300, the other one: AA020-300A.

I bought the first one.

I did not check the date code on the second one. The date code on the one I bought is 12A3. Serial number is in the 77K's. The scanner is at home, and I'm at work, but I can verify the serial number later, if it makes any difference.

The date code is on a sticker inside the battery compartment. On the one I bought, it is also on the back of the box.

Could someone please repost the meaning of the date code? It is my understanding, that 12A3 means 12th month of 1993. Is that correct?

A friend of mine mentioned that the last modifiable PRO-43s were made before April 1994. I don't know if this is correct and I don't know where he got the information from, but his information is usually reliable.

As I have stated before, I have not tried to do any modifications to my PRO-43. I have no immediate plans for doing any, and if I did, I wouldn't tell anybody about it.

>yes, solar powered(battery) cell phones. Pick up one of those and the call is
>answered by the same people that answer when you call 911 on your own cell
>phone - the CHP.

But calling from a roadside callbox is NOT the same as calling from a
vehicular cell phone... although it goes into the same 911 dispatch center,
and goes to the same 911 operators, the callboxes enter the dispatch center
with a lower priority than vehicular-911 and interagency transfer calls.

I can't remember the exact order of the prioritization, I believe it is:

1) landline 911 and vehicular cell calls
2) interagency transfers 911 transfers
3) roadside callboxes

[All the above still considered 911 however. Zenith 12000 might be in
there too... possibly as interagency]

?) Non-emergency calls.

Jerry,

I don't know if this is an option for you or not, but a friend and I
just used a couple of parts from Radio Shack to attach our scanners
to the AM/FM antennas in our cars (we were most interested in the
154-158 band, BTW):

1) I went from using a Pro-43 sitting on the dash, to the same '43 on
the floor attached to the car antenna and get much better reception (of
course!).

2) My friend went from using a mag-mount antenna connected to a
Bearcat (mounted mobile) scanner, to using the AM/FM and can't tell
the difference.

In my friend's case, we swapped back and forth in various drop-out
zones around the area we live and couldn't tell any difference.

Just my own experience, and certainly no plug for RS! :-P

In greater Cincinnati, roadside call boxes are celluar transceivers with tamper devices to include a high decibal alarm on each unit. Theft of these newer units have been reduced though damage and vandalizm remains the same.

Due to the use of celluar service prioity of both conventional celluar service and these call boxes are the same here in Cincy.

Sorry for the spelling....in a hurry

Perhaps the "Radio Shack" label isn't as significant as the leading 'A'
in the serial number. I was told by two reliable sources (one a RS
employee, the other a private investigator who jumped though hoops to
get the "International" version) that the 'A' in the serial number
(not the FCC ID) is the giveaway that the scanner is NOT modifiable.

Yes, I had one in my hands yesterday, asked the clerk if there
were any WITHOUT the 'A' and luckily he had one left. The writer
above claims he mod'ed his unit with a 'A' in the serial number and
it worked... so go figure! Doesn't someone have the real scoop?

Message-ID: <33tp7i$atu@shore.shore.net>
Newsgroup: rec.radio.scanner,alt.radio.scanner,rec.ham-radio
rec.radio.amateur.misc
Organization: North Shore Access; a service of Eco Software, Inc.

Radio monitoring is, as we all know, a fascinating hobby whether it is shortwave listening or to higher frequencies on a scanner. However, its often difficult to know where to listen for specific kind of traffic or to identify what you're hearing. The SW broadcast area is well covered by the WORLD RADIO HANDBOOK, RADIO DATABASE and other publications and the utility bands have the GILFER and KLINGENFUSS guides. However, the scanner buff has a bit of a problem. Due to the fact that most of the VHF-UHF bands are pretty much line-of-sight, reference materials have to be regional in nature. Those scanner listeners who are lucky to live in certain areas like New York City, Boston and other large Metro regions have access to the SCANNER MASTER publications and there are, of course, specialized materials such as books covering the Aeronautical bands available. THE MASTER FREQUENCY FILE by James Tunnell and Robert Kelty (TAB Books Division of McGraw Hill, ISBN 0-8306-4131-9 $29.95) is one of these reference materials which covers U.S. Federal agencies all across the country.

THE MASTER FREQUENCY FILE is an awesome compilation of frequencies, callsigns and user IDs on the 25MHz to 2110 MHz radio spectrum and makes it easy to find and listen to communications from hundreds of sources including:

- The Federal Bureau of Investigation (FBI)

- Drug Enforcement Administration (DEA)

- U.S. Secret Service (USSS)

- U.S. Customs Service (CUSTOMS)

- Internal Revenue Service (IRS)

- Immigration & Naturalization Service (INS) and the Border Patrol

- U.S. Marshal Service

- National Park Service (NPS)

- Alcohol, Tobacco and Firearms (ATF)

- Bureau of Prisons

- Federal Communications Commission (FCC)

and a whole lot more.....

THE MASTER FREQUENCY FILE is national in scope and organized by state. Also included are state maps showing counties, some simple BASIC computer programs, a discussion on secure voice communications and a master resource file. This is a list of a variety of specialized sources, publications and recources around the world ready to assist the radio hobbyist or professional in finding that specific organization, fact, facility or product that is difficult to locate. This also lists U.S. military installations worldwide and a compilation of international Aerospace, Security and Defense exhibitions arranged by month.

THE MASTER FREQUENCY FILE is a bit expensive at $29.95 but well worth it if you are into monitoring Federal radio communications. Authors Tunnell (also author of LATEST INTELLIGENCE published by TAB BOOKS) and Kelty have done an excellent job of organizing this wealth of information into a ready reference work where the answer to your question can be found quickly. In my opinion the master resource file (which is over 125 pages of contacts) is extremely valuable and more than adequately justifies the $30.00 price tag.

Absolutely not. It is directly relevant. Not only is the Triggerfish a scanner accessory, it is directly relevant to the supposed legislation you all think I am gonna get passed that will outlaw all your little scanners.

Would you, PLEASE worry about what you want to say and not what you want other people NOT TO SAY.

Gee, the last time I checked, the GE (EGE) Voice Guard and Aegis systems were
fully digital, 9.6 kb/sec, *DES encrypted* radios. I believe I still
have a copy of the NSA approval certificate somewhere in my files (if only
my files were organized :-).

Neither system uses spread spectrum, but employs a single voice channel
per each carrier, using a Gaussian filtered NRZ signal applied to the FM
modulator. The emmissions fit within the FCC mask for the 25 kHz spaced
LMR services. Spread spectrum would require re-allocating a large portion
of the band.

IMHO, 64 kb/sec speech is a waste of valuable bandwidth for "comm quality"
radios. Voice Guard and Aegis use different forms of subband coding for
speech compression to approximately 9.2 kb/sec.

The Aegis system was used by the Norwegian authorities during the winter
Olympics, albeit under the Ericsson label.

These systems seem to be selling pretty well, so I guess more and more
departments are moving into the non-"silly scrambler" arena. Too bad
for us!

-Rick

High, violent, and doing 100MPH on the freeway.

Not that I excuse the behavior (as evidenced by a amateur
video tape taken in darkness from a single angle mostly after
the fact) of the
LAPD in the RK case, but you have to look at it from the
point of view of the officer sometimes; listen, every call
they go on, they can expect violence to be directed at them;
when it is (i.e. someone obviously under the influence, who has
been pursued quite a distance on the freeway at > 100MPH), they
will respond strongly.

Gee, I hope not. If so, maybe in several years, you'll see this on a
scanner ad:

Full coverage from 29 - 1300 Mhz, except 29.5 thru 53, 109-136, 138-143,
145-511, 513-823, 824-851, 853-868, 869-896, 897-1299. Only $599.99.
Also included is the auto-blockout feature, now required by the FCC,
that allows radio spectrum users to automatically blow-up your scanner
if you tune into their frequencies....

I was kidnapped at gunpoint 10 years ago in Dallas. The gunman wanted
me to drive him to Oklahoma. Luckily, the tank was almost empty and I
convinced him to stop for gas before we got out of town. I ran for it
at the gas station and manage to get away without being killed. I heard
him empty his gun down the street at someone. When the cops came,
they wouldn't even take finger prints from my car!

Just lately, an attempted breakin of my car took place. I heard them,
looked out, saw them before they quickly ran off. They broke into
eight cars in the complex that night. Later that week I spotted them
and reported their liscense plate to the cops with details. Not a
thing has happened to them, as I see them regularly now. I've called
the detective several times, but he never returns my call. I'm tempted
to do some vigulante style justice if this keeps up. ;(

Lousy cops aren't good for anything other than collecting more tax
money via traffic tickets.

IMHO we the people who read these groups ought to reach a consensus about what goes into each newsgroup and stick to it. My humble suggestion: Let's all agree that REC.RADIO.SCANNER is the place for technical and factual information exchange - frequencies, antennas, how different radio technologies work, etc. And let's all agree that ALT.RADIO.SCANNER is the forum for broader discussion or non-technical issues - laws, freedoms, ethics, opinions about commercial practices, etc. Both types of discussions are quite valid but each have a time and a place and probably ought to function separately.

I don't know much about how Usenet is governed. I gather there is some official process far-away to structure newsgroups, but I've always preferred grassrooots consensus to official decisions anyways.

Glen,
I just asked (nicely I might add). There is no mention in my post of
the relevancy of your article. Sounds like you were preloaded about
someone suggesting that it isn't relevant. It's just that I'm growing
weary of your tirades. First a transcript of your phone call to the
White House, now an advertising parody, poorly thought out at that.
Just so much noise, Glen.

> out for sure, I did the mod myself on my unit, found it worked
> and then put the diode back <g>.

I think Mike's wrong, too, but his claim was about the serial number, not the FCC-ID. To hear that a 3A4 was modified . . . that's "news you can use"! What was the serial number?
Thanks.

flarsen@uclink.berkeley.edu (Flemming Larsen)
> I compared the last two units in stock at my local Radio Shack. One had
> the FCC-ID: AA020-300, the other one: AA020-300A.

More news you can use! A report of model number AA020-300*A* being spotted. Oh, how I'd like to know the date of manufacture! All the local RS's here have nothing later than 12A3.

> I did not check the date code on the second one. The date code on the one
> I bought is 12A3. Serial number is in the 77K's. The scanner is at home,
> and I'm at work, but I can verify the serial number later, if it makes any
> difference.

Since a 3A4 was reported modifiable, it's probably not necessary.

> Could someone please repost the meaning of the date code? It is my under-
> standing, that 12A3 means 12th month of 1993. Is that correct?

It is supposed to be so. The cynic might add, "but we're talking RS, here" but I wouldn't.

> As I have stated before, I have not tried to do any modifications to my
> PRO-43. I have no immediate plans for doing any, and if I did, I wouldn't
> tell anybody about it.

But it's not illegal to modify (or so I've been told) so why be concerned? Dealers can't modify because they would then be selling gear that isn't type accepted. Does it matter if the owner modifies a receiver (vis-a-vis FCC regulations. I suppose they'd get bent out of shape if it were a type accepted transmitter.)? Anyone care to set me straight by citing chapter and verse?

I have both a discone with a vertical element that I added and the Radio Shack tri-band wonder antenna. For the most part, the $29 Radio Shack antenna wins, and it usually wins big especially in VHF-Low and 800/900 MHz. They're dead even around 2m up through the cops. And the Radio Shack antenna (the tri-band one, that is) does a much better job on UHF than my discone ever did.

Bottom line - get the $29 antenna, stick some good 52 ohm coax on it (forget the TV coax. It always seems to give me some serious losses that I never notice until I switch over to RG-8 for some odd reason and am amazed at what I can suddenly pick up) Keep the discone for that cheap scanner you have (you do have a cheap extra scanner, don't you???)

1303. 900 MHz cordless phone evaluations

Newsgroup: rec.radio.scanner
Date: 1994-08-30 04:30:56 UTC
From: dsrekcc@giskard.holonet.net
Message-ID: <CvBz7L.MxC@iat.holonet.net>
Source record: 269639
Cross-posted to: rec.radio.scanner,alt.radio.scanner,alt.2600,alt.cellular-phone-tech

I am starting to research 900 MHz cordless phones, planning to purchase before Christmas. Since this is turning into a pretty hot market segment, I figure there's a bunch of folks out there who would be interested in the information I gather.

I am writing a fact sheet for 900 MHz cordless phones. Please send me the appropriate information if:

- Somebody has already done this kind of compiling and I can get to it on the Net (i.e. I don't need to repeat someone else's work)

- There is another newsgroup besides the following that I should be monitoring for information:
alt.2600
alt.cellular-phone-tech
rec.radio.scanner

- You own a 900 MHz cordless phone. I am interested in information such as: quality of sound (echo, compander clamping), range, scannability (audio leakage on other bands), battery life, digital 'encryption', even the weight. I am interested in the digital scheme only as it relates to security against scanner reception.
Note 1: If you've posted to rec.radio.scanner in the past month or so, I already have your information.
Note 2: The Tropez model is fairly common, and I've already got info on it (largely negative), so I'm less interested in that one.

These are the models that I am aware of:

AT&T 9100
BEL 900LX
Panasonic KX-T9220
Sony SPP-ER1
Tropez 900 DL
Uniden EXP9100
Undien EXP9200
Western Union WC9000

If you have any experience or other information, please let me know. I will be compiling the information and reposting, so you can mail directly to me at the address below, or post it to rec.radio.scanner, if you feel that your post is of immediate importance to the public. My alt.newsgroup access is haphazard these days, so I may not receive a post on alt.newsgroups.

My e-mail address is: dsrekcc@prism.gatech.edu
note: not Holonet

>
> More news you can use! A report of model number AA020-300*A* being spotted.
^^^^^

Nope, Jerry, read it again.

AA020-300*A* is the FCC-ID number. The model number is unchanged: 20-300.

I stopped at another Radio Shack store on my way home today to buy a set of hi-capacity NiCad batteries for my PRO-43. I asked to see their remaining stock of PRO-43s. They had two units in stock.

Both units had the AA020-300*A* FCC-ID. They also had an *A* in front of the serial number. One of the units had a date code of 4A4 and a serial number of A0058xx. The date code of the second unit was 5A4.

It appears that the serial number sequence was restarted with the addition of the *A*, since my non-*A* unit has a serial number of 077xxx.

> Since a 3A4 was reported modifiable, it's probably not necessary.
>

That supports my earlier post, that the change took place around 01apr94.

Ken:

You will no doubt want to come back into the US with your scanner, and
you may need to prove ownership thereof to US Customs at the border
when you return. You can take it to the US Customs office in your city
before you leave and fill out a declaration form showing that you own
it. (Register my scanner with the government! Omigosh!)

They have you write a short description of the item(s) and any serial
numbers, then they officially stamp it and hand the piece of paper to
you. If US Customs at the border wants proof of ownership when you
return, just show them the paper. Or you'd better have the sales
receipt showing the serial number somewhere. Otherwise you could end
up paying duty on something you already own. This is not necessary,
however, on items made in the US.

The Customs department suggests you do this before going out of the
country with dutiable items (cameras, computers, personal electronics,
etc).

JE>I'd also like a copoy. Where can I get CS_FRQ40.ZIP?

Hi, Jeff!

The original message assumed the origin line would inform; it
didn't! CS_FRQnn.ZIP, where nn=revision number (now 40) is a list
of the VHF+ frequencies I listen to in the Colorado Springs area.
It isn't comprehensive, it _IS_ long enough to be of general
interest (15K, 15 pages). It's always available to first time
callers at FidoNet 1:128/168, The Comm Center BBS, (719)548-1293.
I'm stu.morrison@commctr.com through that BBS's gateway, otherwise I
have no InterNet or UseNet access.

Hope you get some use from the list!

I listened to the Confederate Air Force (WWII nostalgia rebuilderts and flyers) on 118.7MHz at Frederick MD on August 27, 1994. This seemed to be their main frequency. There was a lot of coordination and behind-the-scenes action for their WWII "re-enactment."

Anyone know if they have their own assigned freq like the Thunderbirds or Blue Angels, or do they use local tower frequencies?

A few Radio Shack stores here in Michigan have pulled the Pro-43 from the shelves saying it's been recalled. Several other stores are still selling them though as a friend of mine just picked one up. The Farmington Hills store was the first I know of to pull the units from the shelves..Anyone else hear of this? It's still in the 95 Catalog....Les...

The walkie talkie was "encrypted" with code. The Navajo "Code Talkers",
speaking a modified native language, baffled not only the enemy, but also
the US cryptographers. A very under recognized bunch of heros. Low tech
can be very effective.

Just because they claim "800 Mhz Coverage" won't necessarily mean its full coverage. The ad would mean more to me if it claimed "Full 800 coverage INCLUDING cellular".

Of course, my BC890 and my brother-in-law's BC8500 (which he returned due to extremely poor performance) claimed "Continuous coverage 20Mhz - 960 Mhz" for the 890 and ""20 Mhz to 1.3 GHz" for the 8500. Therefore one had to ask the salesman if they're truly "continuous" throughout the 800 Mhz range. And they weren't.

I know. Apparently they were in June's Monitoring Times, but being new to scanning, I was unable to find the magazine. Could someone either (re)post the article, fax (415-871-5481) it, or tell me how to get a back issue of the magazine? Also, I'd be very interested in finding the well equiped scanner/radio shops in the San Francsico bay area, not to mention where to find Monitoring Times. Thanks in advance for the help.

All,

You forget, Corporate America has an 'above the law' attitude. They consider themselves far removed from legislation that governs the citizens of the US. They have the lobbyists and lawyers to tie the courts up for years.

I use a RS mutliband vertical scanner antenna in my attic and it works
absolutley outstanding; minimal images (very, very few) and no over load.
Hook the same antenna up to my Pro-51 and, well, useless-city.

I have a Pro-51 and couldn't receive any 800Mhz frequencies from my apartment unless I removed the antenna and then the signals came flooding in. I tried to demonstrate this to the RS salesman but the scanner worked flawlessly in his store. He swapped it out anyway and the new scanner does exactly the same thing. Frequencies below 800Mhz require the antenna, and frequencies above 800Mhz require I remove my antenna. Is there something about my building causing this anomaly? I'm on the 16th floor with line of sight for miles.
I know the scanner is receive only but will operating it without an antenna do any damage to the unit? What's the deal?

I've brought my Pro39 to the airport (thru the X-ray machine) a number of times. I even bring it along when meeting someone who is arriving. (It's very useful to listen to the approach controller to hear final approach orderings/instructions for the particular flight number. My kids have watched their grandparents land by knowing which plane was theirs!)

IMHO, Glen's stuff is some of the more interesting traffic in this group. How many times can you stand to read the same "Does anyone know how to mod a Radio Shack Scanner" message? How many times can you stand to read "Radio Shack Employees are Losers?" Why do I care what frequency the mall cops in San Francisco use, since I will probably never be in San Francisco? Is it noise when someone requests frequencies that are published in Police Call?

Cordless phones totally legal. Cell phones illegal. IMTS mobile phones and most other phones illegal. So, go listen to your neighbors and report them to the cops if you want. You have a RIGHT to monitor them! The U.S. Supreme Court backed that up with a case from Scott County, Iowa!

I've no problem with an RFD for splitting rec.radio.scanner, but not by using alt.radio.scanner, if only because many sites don't carry the alt groups. Let alt.rec.scanner die. There's *nothing* we discuss here that can't be part of rec.*

I think we're all getting punchy. I did not read a post claiming a unit with
an A in the serial number is unmodifiable. The A was in the date of
manufacture, but all dates of manufacture have "A" in them.

> Nope, Jerry, read it again.
> AA020-300*A* is the FCC-ID number. The model number is unchanged: 20-300.

Right. What excited me was an identifiable change in the way the units were labeled. Whether it's the model number or the FCC ID is, in a way, immaterial. What matters is that one of them differs between the modifiable and un modifiable units.
> I asked to see their
> remaining stock of PRO-43s. They had two units in stock.
> Both units had the AA020-300*A* FCC-ID. They also had an *A* in front of
> the serial number. One of the units had a date code of 4A4 and a serial
> number of A0058xx. The date code of the second unit was 5A4.

Thanks to this report, I think we can finally state "THE TRUTH":

Modifiable units: FCC-ID AA020-300, serial number does not begin with A.
Nonmodifiable units: FCC-ID AA020-300A, serial number begins with A.

Anything that doesn't follow this rule should be reported to the group immediately.

It won't hurt the scanner, but I heard about a guy who had a scanner in
his carry-on bag and when they saw the rubber-duckie antenna on x-ray
they thought it was a bomb (because all Hollywood time-bombs have curly
wires).

> taking apart a $350 scanner :)

My Magic 8 Ball says, "Outlook not so good." The posts to date suggest that this unit is unmodifiable. The FCC-ID ends in 300A and the serial number starts with A. No one has reported successfully modifying such a unit.

My suggestion: There *are* modifiable units out there (FCC-ID ending in 300, serial number not beginning with A). Call all your local RSs and ask them to check their stock. When you locate a modifiable unit, swap. (I assume you're still within the 30 day money back period).

2/3/86

TO: DIRECTOR, FBI

FROM: SAC, DETROIT (62A-5733)

CONSTITUENT INQUIRY FROM
CONGRESSMAN CARL PURSELL ON
BEHALF OF GLEN ROBERTS

SA XXX
DETROIT DIVISION
PERSONNEL MATER

Enclosed for the Bureau are the following documents:

1. Note from Congressman CARL PURSELL, dated 1/22/86, addressed to JAMES B. RILEY, Agent in Charge, FBI, Ann Arbor, Michigan.

2. Letter to Congressman PURSELL, dated 1/31/86 from SAC KENNETH P. WALTON, advising him inquiry has been referred to FBIHQ.

3. Newspaper clipping from "Ann Arbor News", dated 9/10/85, regarding GLEN ROBERTS.

4. Two copies of ROBERTS' tabloid FUll Disclosure, dated January and February 1986.

5. A copy of a memorandum, dated 12/27/95, from SA XXX to SAC Detroit, XXX [s] DE-46

6. XXX

7. Two copies of signed statement of SA XXX dated 1/29/86.

XXX as set forth [s] in referenced memo from SA XXX dated 12/27/85. GLEN ROBERTS, whose background is set forth in copies of his tabloid and the "Ann Arbor News" newsclipping, interjected himself into the middle of this surveillance. He monitored and recorded the Agents' transmissions and apparently attempted to identify the subject under surveillance, undoubtedly to warn him of the surveillance. XXX ROBERTS thereafter made a complaint to the Ann Arbor Police Department concerning the call and contacted Congressman PURSELL. The Ann Arbor Police Department intends to take no further action relative to ROBERTS' complaint.

XXX

REQUEST OF THE BUREAU

The Office of Congressional and Public Affairs in concert with the Intelligence Division, is requested to prepare an appropriate response to Congressman PURSELL's inquiry.

1347. BC200XLT cellur mod

Newsgroup: rec.radio.scanner
Date: 1994-08-30 23:18:09 UTC
From: burnssp@gn.ecn.purdue.edu
Message-ID: <340enh$7cl@mozo.cc.purdue.edu>
Source record: 269599

I have a Bearcat 200XLT scanner and am trying to modify it for cellur.
I got the file called BC200.mod which tells how to do this. It mentions
cutting the 10 Kohm resistor above the letter "DEN" on the IC. I opened
my scanner up and found the IC chip. It has the letters "UC-1147A" on it,
where the mod file says "UC 1147" are these the same chip. I saw a small
silver rectangular component with the number 103 above the letters "DEN".
Is that the 10 kohm resistor or does it look like a normal cyclindrical
resistor with a (brown-black-orange) stripe on it. If any one out there
has done the mod , let me know what I am missing. If it is any help
the date of manufacture code is "OA1D"

Thanks,

Steve Burns

I think a nice letter, sent certified mail, to the police department would bring matters to a close, particlarly if you could cite the department's Standard Operating Procedures (probably a public record in your jurisdiction). The idea would be to show that the guidelines for running tags don't authorize or contemplate the officer's behavior.

Might work. On the other hand, the advantage of sending it to the local newspaper is that they cannot ignore it, and the public is informed directly of police misbehavior so that others who may have suffered from it are aware of the extent of the problem. It's also, IMHO, more likely to get someone like the mayor or the ACLU to jump down their throats.

> I know the scanner is receive only but will operating it without an antenna do
> any damage to the unit? What's the deal?

I don't know about your particular scanner, but generally lower frequencies,
with longer wavelengths are received better with a longer antenna, and
higher frequencies, with shorter wavelengths, are received on shorter
antennas. This is why you see cellular phones only having a stump of
an antenna, and short-wave radios (and other lower band receivers) requiring
longer antennas. If you've read short-wave guides, some people even
string an antenna that may be 50 to 100 feet, from their house to a tree.
Anyway, there are some good multi-band antennas, some in your Radio Shack
catalog, that state they're good for reception from 30 to 1300 Mhz. You
may want to check, if the antenna that came with your scanner is crappy
for your area.

|>
|> --
|> ---------------------------------------------------------------------
|> | copeland@metronet.com |
```

Two months after I moved into my apt. I had $1500 worth of stuff stolen out of my car plus $200 to repair the damage to the trunk where they pryed the lock out(I had a trunk release button in the glove box).

Cops came out and I had to make them finger print the car(no prints).

Two months later they tried my girlfriends car,busted the drivers door lock out but the alarm scared them off. So I bought a motion detector that turns lights on a hooked it up outside my bedroom, except I disconnected the lights and hooked up a radio to it,so whenever someone would walk around our cars it would wake me up.;)

One night I forgot to turn it on and my neighbors car got broke into.:(I was pissed.

About four months later,I had just got off work at mid., the radio went off at 1a.m. and sure enough the little bastards where shining there flashlights in our cars. I called the cops so they were on there way, but I couldn't wait!! I got my trusty co2 BB gun and proceded to sneak out the door,I told them to freeze or I would blow their fucking head off!(to many movies:)) they ran and I chased them all around the complex only for them to outrun me :(, but the cops are finally showing up, he saw a car pull out of the next complex down and pulled them over...same pricks.

So they were finding out who they were (and I FORGOT to turn my scanner on) when I remembered my girlfried had wrote down a plate number to a strange car...same car! This got the detectives down there and they got photographed, fingerprinted, their car impounded and a field interigation report, NO arrest. Cops said there was not any laws saying you could not look in a car with

a flash light.Grrr. No damage no tools no arrest.
I have never seen them since.

Same setup netted three car theives,two were on probation,one a newbie.

Even had to goto court for that one.The cop even remembered my
gadget.

I did turn my scanner on for this one, I had to run to the street
to give a direction of travel on the stolen car, the blocker
car tried to run the cop off the road. one HIgh speed chase later
and a canine unit and they had them.

I think I need to move.

jim

1357. Re: Need mods for RS sca

MB> I have RS PRO-2004 and PRO-43 scanners.
MB> The 2004 is already freq'ed, but I need the mod for the 43.
MB> I assume there are FTP or telnet sites for scanner mods, freqs
MB> whatever. Could someone please share these...

Here goes, Mike...PLEASE READ CAREFULLY...

Product: Realistic Pro-43
Purpose: Restore full 800 Mhz continuous coverage
Revised July, 1994

Modification is from the publication Monitoring Times
September, 1992 Page 107

** Warning...This procedure will void your warranty

** Do not attempt this modification unless you are familiar with small component soldering. Performing this modification is done at your own risk. If you don't feel comfortable doing the mod, DON'T.

** Static damage is quite possible as the modification involves work near the microprocessor. A static strap is highly recommended.

** This modification restores certain portions of the 800 Mhz band that is against U.S. federal law to monitor.

** NOTE !!! READ THIS!!!!
If your unit has the letter 'A' before the serial number, your unit will not be capable of modification. Units 4A4 and later

Tools needed...Fine point low powered soldering iron, solder wick or de-soldering tool (I recommend the wick), pointed awl, hemostats or pointed tweezers, small phillips screwdriver, solder.

1. Remove the battery, antenna and back cover (held in place by four screws)

2. Remove the six screws holding the top circuit board in place. Carefully unsolder the two antenna connections from the board. Bend the antenna ground tab fully up form the board. Crefully lift the board, unplugging the black connector at its base, and lay the board out of the way on its bundle of colored wires.

3. Remove the two screws from the next board and lift it, carefully unplugging the white connector at the bottom of the board. Lift it up and lay it aside on its brown wire (which can be unplugged if necessary).

4. Unsolder and remove the metal shield from the final board, revealing the microprocessor; note the row of diodes labelled D1-D5 above it. Only diodes D1, D2 and D4 are present; assisted by a pointed tool, unsolder and remove D4; the lone diode. (This restores full 800 Mhz continuous coverage which will use 30 khz stepping when appropriate.)

5. Re-assemble the scanner, paying particular attention to the alignment of the plugs. Test the radio by entering any frequency in the 800 Mhz band that could not be programmed before.

Modification is complete.

PC> areas on the northeast, mainly Washington and Oregon, or other
PC> frequencies that may be of use.

I hope the shortwave receiver covers the 162 Mhz band as this is where
the NOAA WX freqs are. The freqs are 162.4, 162.4250, 162.4500, 162.4750,
162.500, 162.5250, and 162.5500 Mhz. Sorry, don't know any specific freqs
for that part of the country, but should yield broadcasts from one or more
of the freqs listed.

The above is not true. There were units before the ban that had the
RADIO SHACK logo printed on the case and boxes. This matter was discussed
on CompuServe and was found that the unit was still modifiable.

The only sure way of knowing is to look at the serial number and make
sure there is not a letter 'A' before the serial number. The date code
"3A4" and below are modifiable units.

Obviously, the freqs are just sitting around in the memory. You could
just zero them out, or you could do an all clear by pressing MAN,2 and 9 at
the same time and turn the unit on.

Subj: PRO-51 cellular trick Section: VHF/UHF Scanning
From: Howard Bornstein 76174,637 # 273839, 1 Reply
To: All Date: 02-Jun-94 05:47

There is an interesting test mode in the PRO-51 that, combined with the
direct search feature of the scanner, lets you pick up out-of-band
frequencies. You will have full access to the 66-88 Mhz ranges as well as
the cellular base range of 869-896 Mhz.

Actually, there are several test modes in the PRO-51 (most of these
comments should be true for any Uniden-made Radio Shack scanner, such as
the PRO-46). I'll describe them first and then how to take advantage of
one of them to get the restricted frequencies.

There are three data test modes. These modes completely destroy any
frequencies you had programmed into your scanner, so it's best to use
these techniques before you program your scanner. If you have already
programmed it, you'll have to decide if these new capabilities are worth
reprogramming.

Test mode 0. Clear the scanner.

A well-known method of clearing the scanner to all zeros is to hold down
the 2 key, the 9 key, and turn on the scanner. All frequencies will be
lost.

TEST MODE 1. Fill channels 1-25 with test frequencies.

Press the 2 key, the 9 key, the L/Out key, and turn on the scanner.

This fills channels 1-25 with these frequencies:

1 30.050
2 40.840
3 49.900
4 138.150
5 162.400
6 173.225
7 406.875
8 453.250
9 511.9125
10 108.500
11 118.800
12 127.175
13 135.500
14 66.450*
15 76.825*
16 87.425*
17 157.800
18 482.3625
19 29.000
20 54.000
21 806.000
22 857.200
23 888.96*
24 911.500
25 954.9125

* indicates not within the PRO-51's normal coverage. More on how to use these in a minute.

TEST MODE 2. Fill channels 1-17 with test frequencies.

Press 2, 9, Manual

Fills channels 1-17 with these frequencies:

30.00, 40.00, 50.00, 140.00, 155.00, 170.00, 410.00, 460.00, 510.00,
54.00,
109.00, 118.00, 127.00, 135.00, 810.00, 860.00, 950.00.

There is also a display diagnotic mode.

Display Test Mode.

Press 2, 9, Band or 2, 9, Moni.

This put the display in test mode. Every annunciator and every digit element is turned on in a scan from the left side of the display to the right. To keep this test mode continuous, release the buttons before the first scan finishes. This mode does not affect stored memory. Press any key to exit this display mode.

Now, if you've decided to try test mode 1, you will find several out-of-band frequencies stored in your memory channels. Channels 14-16

hold frequencies in the blocked out 66-88 Mhz range, and channel 23 holds a frequency in the blocked out cellular base range. Once you have these frequencies stored in a memory channel, the PRO-51's direct search feature will let you search though these ranges. In the cellular band, the scanner searches in the correct 30 Khz steps.

You don't have to keep these frequencies in these channels. You can move them to any channel in the scanner. First move them to a monitor channel.

While on a channel with one of these frequencies, open squelch completely. Press direct search button, either up or down. The direct search button puts the scanner into search mode and the open squelch holds the frequency. Then press the Monitor button. The frequency is now in the monitor channel indicated in the display.

Now you can move it to any regular memory channel in the scanner.

Enter the channel number
Press PROG
Press Monitor
Press the number of the monitor channel if the proper channel is not displayed
Press E(nter)

The frequency is now permanently stored in the memory channel. You can do a direct search from this memory channel at any time.

The 66-88 Mhz range mainly covers TV audio. However, there is a strange phenomenon concerning TV audio and the PRO-51. Channels 4, 5, and 6 audio fall within the 66-88 Mhz range, yet the PRO-51 will not pick up the audio frequency while searching in this range. However, TV channel 2 audio is at 59.75 Mhz. When you add the intermediate frequency of 21.6 Mhz, you get an image of the TV channel 2 audio appearing at 81.35 Mhz. This does come in, although raspy, since the PRO-51 is receiving in narrow FM mode while TV audio requires wide band FM mode for proper reception.

: >> difference, but some might...

: >Bull. Program the frequency of your favorite repeater into one channel of
: >your scanner. It is now "amateur equipment."

: >And the local cop doesn't get to decide if it is or if it isn't. You have
: >a FEDERAL license for amateur radio equipment, and the FEDERAL rules
: >pre-empt the state or local rules.

: The law / exemption specifically mentions transcievers. That lets out
: scanners license or no.

A scanner used in conjunction with a transmitter or even another
"transciver" can certainly be described as a transciever arranngeent
and as the FCC preemption did not include any specific definition or
description of exactly what a transciever is, don't expect a local cop,
or judge to have the technical expertise to argue to the contrary
with success.

: With an attitude like yours you will most likely
: get to explain it all to the judge. Lighten up and use lots of greasey "yes
: sir"s and you will have a lot less problems. There is a lot of trouble that
: can and will find you without having to go out of your way to find it.

That's always a generally safe route to take, even though the need
to do so is abominable. Too bad the cops aren't more concerned with
real crime as opposed to harassing anyone with a scanner in the car.

: Nico Garcia
: raoul@athena.mit.edu

It was a press release to the local newspapers (one of which printed a
four-part article about the police department), that prompted the
inappropriate police action (re: running tags and an overbundant prescence
in the neighborhood). It was a friendly chat with the mayor
that stopped the that behavior.

The original incident, a policy of the department not to Mirandize
minors that are "arrested" (well.. the police reports state that they
are arrested and charged with crimes... but the Police Chief insists
they are neither arrested nor charged with any crimes)... was addressed
by the Press... to no apparent avail. The reporter spoke with the ACLU,
but they weren't interested, in that there was no accusation that
any kids were physically beaten by the police.

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source
of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group and
to news.answers every two weeks. You are now reading the first article, which
explains what rec.radio.info is, and answers some Frequently Asked Questions.
The second article is titled "Submission Guidelines", and you only need to
read it if you want to submit an article to rec.radio.info.

You can skip to the next section of this article by searching for the next
" -- " string. The sections available are:
- What is the purpose of rec.radio.info?
- Why are messages almost always cross posted to rec.radio.info?
- What is a 'follow-up', and what does 'moderated' mean?
- OK, so now I know what 'moderated' means. Tell me more.
- What type of material is considered inappropriate?
- I do not have access to news, how can I get the information posted to
rec.radio.info?
- Will the material appearing in rec.radio.info be archived somewhere?
- I have a regular posting with timely information, is there a way to
speed up it's delivery, or automate for more convenience?

-- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with
a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit
chat about radio. Rec.radio.info will contain informational, factual articles
only. Follow-ups are redirected to an appropriate other group, and further
discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it
was decided to create the group as a moderated newsgroup.

-- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered
presentation in rec.radio.info (even with cross-posting, only one message, with

a unique Message-ID, is propogated across the net). This tag also facilitates a pre-existing method of dropping or cancelling the articles locally within the discussion groups if you don't want to see them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:
/Newsgroups:.*[,]rec\.radio\.info/h:j
either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:
rec.radio.info:!s/:^
in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:
sequence
rec.radio.info
rec.radio.
at the end of ~/.nn/init in order to see all the rec.radio.info bulletins first, then read the remaining rec.radio.* without the bulletins.

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, I will assume you have a basic knowledge of Usenet terminology and mechanics.

A moderated group means that any article that needs to be posted to the group has to be accepted by the moderator of the group. Since we need to ensure that followups to an article (discussion) do not show up in the rec.radio.info newsgroup, the `Followup-To:' header line contains a newsgroup that is appropriate for disussions about the specific article.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is Mark Salyzyn. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@ve6mgs.ampr.ab.ca

Comments, criticisms, suggestions or questions about the group can be e-mailed to:
rec-radio-request@ve6mgs.ampr.ab.ca

But before you do so, please be sure to check out the "Submission Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. I receive information in my mailbox; I then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

rec.radio.swap (or possibly comp.newprod) may be more deserving of the posting in any matter.

Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, I would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. I

reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all I can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

brian@UCSD.EDU (Brian Kantor) has kindly supplied a mail list server for rec.radio.info. Non of the articles will be digested, due to their size, so you will receive individual mailings for every article posted to the group.

Mail sent to radio-info@ucsd.edu will be forwarded to the moderator and thus is an alias to rec-radio-info@ve6mgs.ampr.ab.ca

To subscribe and unsubscribe via the listserver; the format for that is

sub address radio-info
unsub address radio-info

where 'address' is your full mailing address. Send this request to

listserv@ucsd.edu

Note that the server will automatically delete any address that bounces mail. If you leave the address portion blank, it will try to deduce your address from the mail headers. This may not work if you are on bitnet, milnet or some other non-Unix host, so it is recommended to put your return address in any case. For example:

sub mymailbox@myhost.mydomain.mil radio-info
or
sub MEMEME01@DMBHST.bitnet radio-info

or something like that.

-- Will the material appearing in rec.radio.info be archived somewhere?

< Dated information here >

Yes. Still firming up details at the moment but here is a preliminary list:
- unbc.edu as maintained by Lyndon Nerenberg <lyndon@unbc.edu>
- nic.funet.fi maintained by Risto Kotalampi <rko@cs.tut.fi>
saved to /pub/dx/text/rec.radio.info currently stored as numbered files.

Effectively this means that anything you post to rec.radio.info will be permanently stored, so your work will not be lost.

-- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat

transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as time critical.

We refer to this as self-moderation, which is partly based on the model for news.answer. This requires co-operation and good will to be beneficial to the community in the rec.radio hierarchy.

I suggest reading the posting guidelines for more information. I am open to suggestions.

I thank the following individuals for their input into this article:
rec.music.info moderator Leo Breebaart rec-music-info@cp.tn.tudelft.nl
rec.radio.broadcasting moderator Bill Pfeiffer wdp@gagme.chi.il.us
Paul W. Schleck, KD3FU pschleck@unomaha.edu
Ian Kluft, KD6EUI ikluft@uts.amdahl.com

FYI, in the Golden Stae, we have a law against monitoring cordless phones.

California Penal Code Sec. 632.6. Intercepting or Receiving
Cordless Telephone Communication; Penalty; Exceptions

(a) Every person who, maliciously and without the consent
of all parties to the communication, intercepts, receives,
or assists in intercepting or receiving a communication
transmitted between cordless telephones as defined in
subdivision (c), between any cordless telephone and a
landline telephone, or between a cordless telephone and a
cellular telephone shall be punished by a fine not exceeding
two thousand five hundred dollars ($2,500), by imprisonment
in the county jail not exceeding one year or in the state
prison, or by both that fine and imprisonment. If the person
has been previously convicted of a violation of this section
or Section 631,632, 632.5, 632.7, or 636, the person shall be
punished by a fine not exceeding ten thousand dollars
($10,000), by imprisonment in the countyjail not exceeding one
year or in the state prison, or by both that fine and
imprisonment.
(b) In the following instances, this section shall not apply:
(1) To any public utility engaged in the business of providing
communication services and facilities, or to the officers,
employees, or agents thereof, where the acts otherwise

prohibited are for the purpose of construction, maintenance,
conduct, or operation of the services and facilities of the
public utility.
(2) To the use of any instrument, equipment, facility, or
service furnished and used pursuant to the tariffs of the
public utility.
(3) To any telephonic communication system used for communication
exclusively within a state, county, city and county, or city
correctional facility.
(c) As used in this section and section 635, "cordless telephone"
means a two-way low power communications system consisting of two
parts-a "base" unit which connects to the public switched
telephone network and a handset or "remote" unit-which are
connected by a radio link and authorized by the Federal
Communications Commission to operate in the frequency bandwidth
reserved for cordless telephones. Leg.H. 1990
ch. 696, 1992 ch. 298

From: pas@cc.gatech.edu
Message-ID: <340t0h$l3@homepark.cc.gatech.edu>
Source record: 269695

Radio Shack has the Silent Play again on final closeout.
This time it is going for $14.97. Get them while you can.
It's Radio Shack part number is 270-1715.

Silent Play consists of a low-power FM transmitter + a standard
FM receiver with headphones. It's a wonderful addition to listen
to your scanner through your audio system (home or auto). Many of
us here in rec.radio.scanner went out an bought what we thought was
the remaining stock for $20 each earlier this year.

I am not affiliated with Radio Shack. Actually, I don't even
like the place. But hey, this is a good and useful product,
at an excellent price. Go for it.

>causing this anomaly? I'm on the 16th floor with line of sight for miles.
>I know the scanner is receive only but will operating it without an antenna do
>any damage to the unit? What's the deal?

One thing I can think of is that the '51 is overloaded in this frequencey
range: there may be a/some very close/strong signals in the 800MHz band
that are causing the reciever to desensitize in an attempt to not overload
the unit. When you remove the antenna, it casuing the strong, offending
signal to drop down, effectively causing the scanner to hear better, ...
in a sense!

I've heard discussions of this happening on other scanners when used near
NOAA weather towers, broadcast towers, etc. Are you using the scanner
near anything close that you know of that might be doing this?

Anyone else have any ideas?

Actually, I don't think they modified their language any. Navajo is a
seriously complex language. Apparently the code talkers had to make up
words to describe things that had no words in their language, like
bomber, ship, etc.

I think there were some simple scrambling systems during WWII, some of
which were as simple as spectral inversion. THe White House phone to
Winston Churchill had a more sophisticated scrambler, but I don't know if
any portable units had decent scramblers.

I'd like to see someone challenge it on federal pre-emption. Federal laws are designed to supercede state laws. States shouldn't be regulating communications. That is the task of the FCC. If it were taken to the U.S. Supreme Court, I bet it would be a good challenge....any lawyers out there with some insight?

>I've brought my Pro39 to the airport (thru the X-ray machine)
>a number of times. I even bring it along when meeting someone

I've taken my Pro-43 (and my Icom-W2A) to the Airport many times and it's never been through the X-ray machine. I just leave it on my belt, blatantly obvious, turned on and tuned to some _active_ frequency. They've never asked me to pass it through the X-ray machine. Make it obvious that it's a radio, and no one will bother you.

Frequency counters, though, bear an uncanny resemblence to the stereotype remote bomb detonator and will fetch questions. Beware!

Obvious extension of this idea: Use a scanner, with speaker and volume so that it's audible from outside where the thieves are! If they think there's a chance of a police cruiser being in the area, they'll leave VERY fast.

If you phone the cops and they hear the call to that location they'll leave even faster.

Some folks have been setting up video cameras in windows that look down on the alleys in this area, with signs at eye level in the alley advising of video surveliance. Consider that if you feed the camera video to a VCR you can record eight hours straight at EP. The fun thing here is that while there may be problems with "the authorities" setting up video survelliance systems, there's nothing on the books to stop private citizens from doing so...

Depends on where you are. California that prohibits listening to cordless phones as well as cellular and other mobile. The ECPA does not specifically say that it's ok to monitor cordless phones; they simply are not covered under the definition of the phones that are illegal to monitor, so there is no issue of federal pre-emption. But I don't know if it's been upheld in court. (Any good lawyer -- er, just so we know what I am and am not saying, make that "any competent lawyer" -- will tell you that statutory laws means little until there is case law that upholds them.)

Given that your scanner works differently in another location,
perhaps you live very close to a transmitter in the 800-950 MHz range
which is overloading your scanner.

It would be just as likely to bring you to a close. The only thing they
understand is superior force, in this case, superior political force
might do, if you've got friends in the media to back your play.

Don't have to. Note the drawn blinds in the upstairs window in the house
across the street.

Paul Cordingley (paul.cordingley@canrem.com) wrote:

: IMHO we the people who read these groups ought to reach a consensus about
: what goes into each newsgroup and stick to it. My humble suggestion:
: Let's all agree that REC.RADIO.SCANNER is the place for technical and
: factual information exchange - frequencies, antennas, how different radio
: technologies work, etc. And let's all agree that ALT.RADIO.SCANNER is the
: forum for broader discussion or non-technical issues - laws, freedoms,
: ethics, opinions about commercial practices, etc. Both types of discussions
: are quite valid but each have a time and a place and probably ought to
: function separately.

I disagree. Rec.radio.scanner was intended to replace alt.radio.scanner,
as many sites (like mine) do not receive alt groups, leaving many
scanner fans out in the cold.

When rec.radio.scanner began, alt.radio.scanner was supposed to just
wither away. Rather than cross posting, I suggest everyone stick to
posting solely to rec.radio.scanner.

There isn't so much traffic on this group that it cannot withstand
discussions of all facets of scanner listening.

Good listening,

Jim

1393. Newcommer AOR AR-3000 questions.

Newsgroup: rec.radio.scanner
Date: 1994-08-31 14:00:54 UTC

1. I am looking for a remote control program (over RS-232) for my AR-3000.
The program should be running on an IBM PC.

It should be able to scan frequency bands, log field strength statistics and
give a graphical overview about the long term band activity.

I saw several programs for Icom and Kenwood rigs on ftp.funet.fi in
/pub/ham/misc, but I didn't found any programs for the AOR AR-3000.
I searched with archie and veronica, but I found really nothing.

There aren't any sources for the Icom and Kenwood programs on the net only
the binaries. Has anybody a program for the AR-3000 or the sources for
the Icom and Kenwood programs? If I get this sources I will modify them
for the AR-3000 and post them on the net.

2. Are the newsgroups rec.radio.scanner, alt.scanner or rec.radio.digital.misc
achieved by any anonymous ftp side?

3. There are a lot of programs to decode packet radio (AX25).
They need different hardware support (TNC, FSK-Modem or a single OP-circuit
at the serial port of the PC).

The program pktmon12.pas for example can decode AX25. It only needs
a OP which convert the scanner audio input in a binary RS-232 signal.
It comes with full source code and works very fine on strong signals.

Has anybody modified pktmon12.pas or any similar programs to decode

a) the number dialed by any kind of mobile phones
b) the number dialed by any kind of cellular phones
c) the number dialed by any kind of cordless phones
d) POSAG paging signals
e) airplane VHF-transponder signals
f) any other digital stuff?

Wouldn't it be nice to do it and make the software PD to share the work?

But is this the right newsgroup to talk about decoding digital signals?
The netters in rec.radio.digital.misc seem to be only interested in
decoding AX25.

Please respond by email. I will post a summary.

Thanks in advance. Bye,

Karl
